

**NCT5532D**  
**Nuvoton LPC I/O**

Date: September 30<sup>th</sup>, 2011 Revision 0.7

**Table of Contents –**

1.	GENERAL DESCRIPTION .....	1
2.	FEATURES .....	2
3.	BLOCK DIAGRAM .....	5
4.	PIN LAYOUT .....	6
5.	PIN DESCRIPTION.....	7
5.1	LPC Interface .....	8
5.2	Serial Port Interface .....	8
5.3	KBC Interface.....	8
5.4	CIR Interface.....	9
5.5	Hardware Monitor Interface .....	9
5.6	Intel® PECL Interface .....	10
5.7	Advanced Configuration & Power Interface.....	10
5.8	Advanced Sleep State Control.....	10
5.9	SMBus Interface .....	11
5.10	Power Pins.....	11
5.11	AMD Power-On Sequence .....	11
5.12	AMD SB-TSI Interface .....	12
5.13	Dual Voltage Control.....	12
5.14	DSW.....	12
5.15	IR .....	12
5.16	General Purpose I/O Port .....	12
5.16.1	GPIO-2 Interface .....	12
5.16.2	GPIO-4 Interface .....	13
5.16.3	GPIO-5 Interface .....	13
5.16.4	GPIO-7 Interface .....	14
5.16.5	GPIO-8 Interface .....	14
5.17	Strapping Pins.....	15
5.18	Internal pull-up, pull-down pins .....	15
6.	GLUE LOGIC .....	17
6.1	ACPI Glue Logic .....	17
6.2	BKFD_CUT & LATCH_BKFD_CUT.....	19
6.3	3VSBSW#.....	20
6.4	PSON# Block Diagram .....	21
6.5	PWROK .....	22
6.6	Front Panel LEDs.....	23
6.6.1	Automatic Mode .....	23
6.6.2	Manual Mode .....	24
6.6.3	S0~S5 LED Blink Block Diagram .....	24
6.6.4	LED Pole (LED_POL) .....	25
6.6.5	Deeper Sleeping State Detect Function .....	26
6.7	Advanced Sleep State Control (ASSC) Function .....	28
6.7.1	When ASSC is disabled .....	28
6.7.2	When ASSC is enabled (Enter into Deeper Sleeping State) .....	29
6.7.3	When ASSC is enabled (Exit Deeper Sleeping State) .....	29
6.7.4	SLP_S5#_LATCH Control Function .....	30

6.8	Intel DSW Function .....	31
6.8.1	Enter DSW State timing diagram .....	31
6.8.2	Exit DSW State timing diagram .....	32
6.8.3	Application Circuit .....	32
6.9	AMD Power-On Sequence .....	33
7.	CONFIGURATION REGISTER ACCESS PROTOCOL .....	35
7.1	Configuration Sequence .....	37
7.1.1	Enter the Extended Function Mode .....	37
7.1.2	Configure the Configuration Registers .....	37
7.1.3	Exit the Extended Function Mode .....	38
7.1.4	Software Programming Example .....	38
8.	HARDWARE MONITOR .....	39
8.1	General Description .....	39
8.2	Access Interfaces .....	39
8.3	LPC Interface .....	39
8.4	I <sup>2</sup> C interface .....	41
8.5	Analog Inputs .....	42
8.5.1	Voltages Over 2.048 V or Less Than 0 V .....	43
8.5.2	Voltage Data Format .....	43
8.5.3	Temperature Data Format .....	43
8.6	PECI .....	46
8.7	Fan Speed Measurement and Control .....	48
8.7.1	Fan Speed Reading .....	48
8.7.2	Fan Speed Calculation by Fan Count Reading .....	48
8.7.3	Fan Speed Calculation by Fan RPM Reading .....	48
8.7.4	Fan Speed Control .....	48
8.7.5	SMART FAN™ Control .....	49
8.7.6	Temperature Source & Reading for Fan Control .....	50
8.8	SMART FAN™ I .....	50
8.8.1	Thermal Cruise Mode .....	50
8.8.2	Speed Cruise Mode .....	52
8.9	SMART FAN™ IV & Close Loop Fan Control Mode .....	53
8.9.1	Step Up Time / Step Down Time .....	56
8.9.2	Fan Output Step .....	56
8.9.3	Revolution Pulse Selection .....	57
8.9.4	Weight Value Control .....	57
8.10	Alert and Interrupt .....	59
8.10.1	SMI# Interrupt Mode .....	60
8.10.2	Voltage SMI# Mode .....	60
8.10.3	Fan SMI# Mode .....	60
8.10.4	Temperature SMI# Mode .....	60
8.10.5	OVT# Interrupt Mode .....	64
9.	HARDWARE MONITOR REGISTER SET .....	66
9.1	Address Port (Port x5h) .....	66
9.2	Data Port (Port x6h) .....	66
9.3	SYSFANOUT PWM Output Frequency Configuration Register – Index 00h (Bank 0) .....	67
9.4	SYSFANOUT Output Value Select Register – Index 01h (Bank 0) .....	67
9.5	CPUFANOUT PWM Output Frequency Configuration Register – Index 02h (Bank 0) .....	68

9.6	CPUFANOUT Output Value Select Register – Index 03h (Bank 0) .....	69
9.7	SYSFANOUT Configuration Register I – Index 04h (Bank 0) .....	69
9.8	Reserved Register – Index 05h ~ 0Fh (Bank 0) .....	70
9.9	Reserved Register – Index 10h (Bank 0) .....	70
9.10	Reserved Register – Index 11h (Bank 0) .....	70
9.11	Reserved Register – Index 12h (Bank 0) .....	70
9.12	Reserved Register – Index 13h (Bank 0) .....	70
9.13	Reserved Register – Index 14h (Bank 0) .....	70
9.14	Reserved Register – Index 15h (Bank 0) .....	70
9.15	Reserved Register – Index 16-17h (Bank 0) .....	70
9.16	OVT# Configuration Register – Index 18h (Bank 0) .....	70
9.17	Reserved Registers – Index 19h ~ 1Fh (Bank 0) .....	70
9.18	Value RAM — Index 27h ~ 3Fh (Bank 0) .....	70
9.19	Configuration Register – Index 40h (Bank 0) .....	71
9.20	Interrupt Status Register 1 – Index 41h (Bank 0) .....	72
9.21	Interrupt Status Register 2 – Index 42h (Bank 0) .....	72
9.22	SMI# Mask Register 1 – Index 43h (Bank 0) .....	73
9.23	SMI# Mask Register 2 – Index 44h (Bank 0) .....	73
9.24	Interrupt Status Register 4 – Index 45h (Bank 0) .....	73
9.25	SMI# Mask Register 3 – Index 46h (Bank 0) .....	74
9.26	Reserved Register – Index 47h (Bank 0) .....	74
9.27	Serial Bus Address Register – Index 48h (Bank 0) .....	74
9.28	Reserved Register – Index 49h ~ 4Bh (Bank 0) .....	75
9.29	SMI/OVT Control Register1 – Index 4Ch (Bank 0) .....	75
9.30	FAN IN/OUT Control Register – Index 4Dh (Bank 0) .....	75
9.31	Bank Select Register – Index 4Eh (Bank 0) .....	76
9.32	Nuvoton Vendor ID Register – Index 4Fh (Bank 0) .....	76
9.33	Reserved Register – Index 50h (Bank 0) .....	77
9.34	Reserved Register – Index 51h ~ 57h (Bank 0) .....	77
9.35	Chip ID – Index 58h (Bank 0) .....	77
9.36	Reserved Register – Index 59h ~ 5Ch (Bank 0) .....	77
9.37	VBAT Monitor Control Register – Index 5Dh (Bank 0) .....	77
9.38	Current Mode Enable Register – Index 5Eh (Bank 0) .....	78
9.39	Reserved Register – Index 5F (Bank 0) .....	79
9.40	Reserved Register – Index 60 (Bank 0) .....	79
9.41	Reserved Register – Index 61F ~ 72F (Bank 0) .....	79
9.42	MONITOR TEMPERATURE 1 Register (Integer Value)- Index 73h (Bank 0) .....	79
9.43	MONITOR TEMPERATURE 1 Register (Fractional Value)- Index 74h (Bank 0) .....	79
9.44	MONITOR TEMPERATURE 2 Register (Integer Value)- Index 75h (Bank 0) .....	79
9.45	MONITOR TEMPERATURE 2 Register (Fractional Value)- Index 76h (Bank 0) .....	80
9.46	Reserved Register - Index 77h (Bank 0) .....	80
9.47	Reserved Register - Index 78h (Bank 0) .....	80
9.48	Reserved Register - Index 79h (Bank 0) .....	80
9.49	Reserved Register - Index 7Ah (Bank 0) .....	80
9.50	Reserved Register - Index 7Ch (Bank 0) .....	80
9.51	Reserved Register – Index 7Dh~ADh (Bank 0) .....	80

9.52	PECI Temperature Reading Enable for SMIOVT and SMART FAN Control Register – Index AEh (Bank 0) .....	80
9.53	BEEP Control Register 1 – Index B2h (Bank0) .....	81
9.54	BEEP Control Register 2 – Index B3h (Bank0) .....	81
9.55	BEEP Control Register 3 – Index B4h (Bank0) .....	82
9.56	BEEP Control Register 4 – Index B5h (Bank0) .....	82
9.57	SYSFAN Monitor Temperature Source Select Register/ STOPDUTY Enable Register – Index 00h (Bank 1) .....	83
9.58	SYSFAN Target Temperature Register / SYSFANIN Target Speed_L Register – Index 01h (Bank 1) .....	84
9.59	SYSFAN MODE Register / SYSFAN TOLERRANCE Register – Index 02h (Bank 1) .....	84
9.60	SYSFANOUT Step Up Time Register – Index 03h (Bank 1) .....	85
9.61	SYSFANOUT Step Down Time Register – Index 04h (Bank 1) .....	85
9.62	SYSFANOUT Stop Value Register – Index 05h (Bank 1) .....	85
9.63	SYSFANOUT Start-up Value Register – Index 06h (Bank 1) .....	86
9.64	SYSFANOUT Stop Time Register – Index 07h (Bank 1) .....	86
9.65	Reserved Register – Index 08h (Bank 1) .....	86
9.66	SYSFANOUT Output Value Select Register – Index 09h (Bank 1) .....	86
9.67	Reserved Register – Index 0Ah~0Bh (Bank 1) .....	87
9.68	SYSFANIN Tolerance_H / Target Speed_H Register – Index 0Ch (Bank 1) .....	87
9.69	Reserved Register – Index 0Dh~1Fh (Bank 1) .....	87
9.70	SMART FAN IV SYSFANOUT STEP Register – Index 20h (Bank 1) .....	87
9.71	SYSFAN (SMART FAN™ IV) Temperature 1 Register(T1) – Index 21h (Bank 1) .....	87
9.72	SYSFAN (SMART FAN™ IV) Temperature 2 Register(T2) – Index 22h (Bank 1) .....	88
9.73	SYSFAN (SMART FAN™ IV) Temperature 3 Register(T3) – Index 23h (Bank 1) .....	88
9.74	SYSFAN (SMART FAN™ IV) Temperature 4 Register(T4) – Index 24h (Bank 1) .....	88
9.75	Reserved Register – Index 25h~26h (Bank 1) .....	89
9.76	SYSFAN (SMART FAN™ IV) DC/PWM 1 Register – Index 27h (Bank 1) .....	89
9.77	SYSFAN (SMART FAN™ IV) DC/PWM 2 Register – Index 28h (Bank 1) .....	89
9.78	SYSFAN (SMART FAN™ IV) DC/PWM 3 Register – Index 29h (Bank 1) .....	89
9.79	SYSFAN (SMART FAN™ IV) DC/PWM 4 Register – Index 2Ah (Bank 1) .....	89
9.80	Reserved Register – Index 2Bh~30h (Bank 1) .....	90
9.81	SYSFAN 3-Wire Enable Register – Index 31h (Bank 1) .....	90
9.82	Reserved Register – Index 32h~34h (Bank 1) .....	90
9.83	SYSFAN (SMART FAN™ IV) Critical Temperature Register – Index 35h (Bank 1) ....	90
9.84	SYSFAN Enable Critical Duty – Index 36h (Bank 1) .....	90
9.85	SYSFAN Critical Duty Register – Index 37h (Bank 1) .....	91
9.86	SYSFANOUT Critical Temperature Tolerance Register – Index 38h (Bank 1) .....	91
9.87	Weight value Configuration Register – Index 39h (Bank 1) .....	91
9.88	SYSFANOUT Temperature Step Register – Index 3Ah (Bank 1) .....	92
9.89	SYSFANOUT Temperature Step Tolerance Register – Index 3Bh (Bank 1) .....	92
9.90	SYSFANOUT Weight Step Register – Index 3Ch (Bank 1) .....	93
9.91	SYSFANOUT Temperature Base Register – Index 3Dh (Bank 1) .....	93
9.92	SYSFANOUT Temperature Fan Duty Base Register – index 3Eh (Bank 1) .....	93
9.93	SYSFAN PECIERR DUTY Enable Register – Index 3Fh (Bank 1) .....	93
9.94	Reserved Register – Index 40h (Bank 1) .....	94
9.95	SYSFANOUT Pre-Configured Register For PECI Error – Index 41h (Bank 1) .....	94

9.96	Reserved Register – Index 42h ~ 4Fh (Bank 1) .....	94
9.97	SMIOVT2 Temperature Source (High Byte) Register – Index 50h (Bank 1).....	94
9.98	SMIOVT2 Temperature Source (Low Byte) Register – Index 51h (Bank 1).....	94
9.99	SMIOVT2 Temperature Source Configuration Register – Index 52h (Bank 1) .....	95
9.100	SMIOVT2 Temperature Source Hysteresis (High Byte) Register – Index 53h (Bank 1) 95	
9.101	SMIOVT2 Temperature Source Hysteresis (Low Byte) Register – Index 54h (Bank 1)	95
9.102	SMIOVT2 Temperature Source Over-temperature (High Byte) Register – Index 55h (Bank1)	96
9.103	SMIOVT2 Temperature Source Over-temperature (Low Byte) Register – Index 56h (Bank 1)	96
9.104	Reserved Register – Index 57h ~ FFh (Bank 1) .....	96
9.105	CPUFAN Monitor Temperature Source Select Register/ STOPDUTY Enable Register – Index 00h (Bank 2) .....	96
9.106	CPUFAN Target Temperature Register / CPUFANIN Target Speed_L Register – Index 01h (Bank 2).....	97
9.107	CPUFAN MODE Register / CPUFAN TOLERRANCE Register – Index 02h (Bank 2)	98
9.108	CPUFANOUT Step Up Time Register – Index 03h (Bank 2) .....	98
9.109	CPUFANOUT Step Down Time Register – Index 04h (Bank 2).....	98
9.110	CPUFANOUT Stop Value Register – Index 05h (Bank 2).....	99
9.111	CPUFANOUT Start-up Value Register – Index 06h (Bank 2) .....	99
9.112	CPUFANOUT Stop Time Register – Index 07h (Bank 2).....	99
9.113	Reserved Register – Index 08h (Bank 2) .....	99
9.114	CPUFANOUT Output Value Select Register – Index 09h (Bank 2) .....	99
9.115	Reserved Register – Index 0Ah~0Bh (Bank 2) .....	100
9.116	CPUFANIN Tolerance_H / Target Speed_H Register – Index 0Ch (Bank 2).....	100
9.117	Reserved Register – Index 0Dh~1Fh (Bank 2) .....	100
9.118	SMART FAN IV CPUFANOUT STEP Register – Index 20h (Bank 2).....	100
9.119	CPUFAN (SMART FAN™ IV) Temperature 1 Register(T1) – Index 21h (Bank 2).....	100
9.120	CPUFAN (SMART FAN™ IV) Temperature 2 Register(T2) – Index 22h (Bank 2).....	101
9.121	CPUFAN (SMART FAN™ IV) Temperature 3 Register(T3) – Index 23h (Bank 2).....	101
9.122	CPUFAN (SMART FAN™ IV) Temperature 4 Register(T4) – Index 24h (Bank 2).....	101
9.123	Reserved Register – Index 25h~26h (Bank 2) .....	102
9.124	CPUFAN (SMART FAN™ IV) PWM1 Register – Index 27h (Bank 2).....	102
9.125	CPUFAN (SMART FAN™ IV) PWM2 Register – Index 28h (Bank 2).....	102
9.126	CPUFAN (SMART FAN™ IV) PWM3 Register – Index 29h (Bank 2).....	102
9.127	CPUFAN (SMART FAN™ IV) PWM4 Register – Index 2Ah (Bank 2).....	102
9.128	Reserved Register – Index 2Bh~30h (Bank 2).....	103
9.129	CPUFAN 3-Wire FAN Enable Register – Index 31h (Bank 2).....	103
9.130	Reserved Register – Index 32h ~ 34h(Bank 2) .....	103
9.131	CPUFAN (SMART FAN™ IV) Critical Temperature Register – Index 35h (Bank 2) ..	103
9.132	CPUFAN Enable Critical Duty – Index 36h (Bank 2).....	103
9.133	CPUFAN Critical Duty Register – Index 37h (Bank 2).....	104
9.134	CPUFANOUT Critical Temperature Tolerance Register – Index 38h (Bank 2).....	104
9.135	Weight value Configuration Register – Index 39h (Bank 2) .....	104
9.136	CPUFANOUT Temperature Step Register – Index 3Ah (Bank 2).....	105
9.137	CPUFANOUT Temperature Step Tolerance Register – Index 3Bh (Bank 2).....	105

9.138	CPUFANOUT Weight Step Register – Index 3Ch (Bank 2) .....	106
9.139	CPUFANOUT Temperature Base Register – Index 3Dh (Bank 2) .....	106
9.140	CPUFANOUT Temperature Fan Duty Base Register – Index 3Eh (Bank 2) .....	106
9.141	CPUFAN PECCIERR DUTY Enable Register – Index 3Fh (Bank 2) .....	106
9.142	Reserved Register – Index 40h (Bank 2) .....	107
9.143	CPUFANOUT Pre-Configured Register For PECI Error – Index 41h (Bank 2) .....	107
9.144	Reserved Register – Index 42h ~ FFh (Bank 1) .....	107
9.145	Reserved Register – Index 00h (Bank 3) .....	107
9.146	Reserved Register – Index 01h (Bank 3) .....	107
9.147	Reserved Register – Index 02h (Bank 3) .....	107
9.148	Reserved Register – Index 03h (Bank 3) .....	107
9.149	Reserved Register – Index 04h (Bank 3) .....	107
9.150	Reserved Register – Index 05h (Bank 3) .....	107
9.151	Reserved Register – Index 06h (Bank 3) .....	107
9.152	Reserved Register – Index 07h (Bank 3) .....	107
9.153	Reserved Register – Index 08h (Bank 3) .....	107
9.154	Reserved Register – Index 09h (Bank 3) .....	107
9.155	Reserved Register – Index 0Ch (Bank 3) .....	108
9.156	Reserved Register – Index 0Dh (Bank 3) .....	108
9.157	Reserved Register – Index 20h (Bank 3) .....	108
9.158	Reserved Register – Index 21h (Bank 3) .....	108
9.159	Reserved Register – Index 22h (Bank 3) .....	108
9.160	Reserved Register – Index 23h (Bank 3) .....	108
9.161	Reserved Register – Index 24h (Bank 3) .....	108
9.162	Reserved Register – Index 25h~26h (Bank 3) .....	108
9.163	Reserved Register – Index 27h (Bank 3) .....	108
9.164	Reserved Register – Index 28h (Bank 3) .....	108
9.165	Reserved Register – Index 29h (Bank 3) .....	108
9.166	Reserved Register – Index 2Ah (Bank 3) .....	108
9.167	Reserved Register – Index Index 2Bh~30h (Bank 3) .....	108
9.168	Reserved Register – Index 31h (Bank 3) .....	108
9.169	Reserved Register – Index 32h~34h (Bank 3) .....	108
9.170	Reserved Register – Index 35h (Bank 3) .....	108
9.171	Reserved Register – Index 36h (Bank 3) .....	108
9.172	Reserved Register – Index 37h (Bank 3) .....	108
9.173	Reserved Register – Index 38h (Bank 3) .....	108
9.174	Reserved Register – Index 39h (Bank 3) .....	108
9.175	Reserved Register – Index 3Ah (Bank 3) .....	108
9.176	Reserved Register – Index 3Bh (Bank 3) .....	109
9.177	Reserved Register – Index 3Ch (Bank 3) .....	109
9.178	Reserved Register – Index 3Dh (Bank 3) .....	109
9.179	Reserved Register – Index 3Eh (Bank 3) .....	109
9.180	Reserved Register – Index 3Fh (Bank 3) .....	109
9.181	Reserved Register – Index 40h (Bank 3) .....	109
9.182	Reserved Register – Index 41h (Bank 3) .....	109
9.183	Reserved Register – Index 42h ~ FFh (Bank 3) .....	109
9.184	PCH_CHIP_CPU_MAX_TEMP Register – Index 00h (Bank 4) .....	109

9.185	PCH_CHIP_TEMP Register – Index 01h (Bank 4).....	109
9.186	PCH_CPU_TEMP_H Register – Index 02h (Bank 4).....	109
9.187	PCH_CPU_TEMP_L Register – Index 03h (Bank 4).....	110
9.188	PCH_MCH_TEMP Register – Index 04h (Bank 4).....	110
9.189	PCH_DIM0_TEMP Register – Index 05h (Bank 4).....	110
9.190	PCH_DIM1_TEMP Register – Index 06h (Bank 4).....	111
9.191	PCH_DIM2_TEMP Register – Index 07h (Bank 4).....	111
9.192	PCH_DIM3_TEMP Register – Index 08h (Bank 4).....	111
9.193	PCH_TSI0_TEMP_H Register – Index 09h (Bank 4).....	111
9.194	PCH_TSI0_TEMP_L Register – Index 0Ah (Bank 4).....	112
9.195	PCH_TSI1_TEMP_H Register – Index 0Bh (Bank 4).....	112
9.196	PCH_TSI1_TEMP_L Register – Index 0Ch (Bank 4).....	112
9.197	PCH_TSI2_TEMP_H Register – Index 0Dh (Bank 4).....	112
9.198	PCH_TSI2_TEMP_L Register – Index 0Eh (Bank 4).....	113
9.199	PCH_TSI3_TEMP_H Register – Index 0Fh (Bank 4).....	113
9.200	PCH_TSI3_TEMP_L Register – Index 10h (Bank 4).....	113
9.201	PCH_TSI4_TEMP_H Register – Index 11h (Bank 4).....	114
9.202	PCH_TSI4_TEMP_L Register – Index 12h (Bank 4).....	114
9.203	PCH_TSI5_TEMP_H Register – Index 13h (Bank 4).....	114
9.204	PCH_TSI5_TEMP_L Register – Index 14h (Bank 4).....	114
9.205	PCH_TSI6_TEMP_H Register – Index 15h (Bank 4).....	115
9.206	PCH_TSI6_TEMP_L Register – Index 16h (Bank 4).....	115
9.207	PCH_TSI7_TEMP_H Register – Index 17h (Bank 4).....	115
9.208	PCH_TSI7_TEMP_L Register – Index 18h (Bank 4).....	115
9.209	ByteTemp_H Register – Index 19h (Bank 4).....	116
9.210	ByteTemp_L Register – Index 1Ah (Bank 4).....	116
9.211	Reserved Register – Index 1Bh ~ 22h (Bank 4).....	116
9.212	Reserved Register – Index 23h (Bank 4).....	116
9.213	Reserved Register – Index 24h (Bank 4).....	116
9.214	Reserved Register – Index 25h (Bank 4).....	116
9.215	Reserved Register – Index 26h (Bank 4).....	116
9.216	AVCC High Limit Compared Voltage Register – Index 27h (Bank 4).....	116
9.217	AVCC Low Limit Compared Voltage Register – Index 28h (Bank 4).....	117
9.218	Reserved Register – Index 29h ~ 41h (Bank 4).....	117
9.219	Voltage Comparison Interrupt Status Register - Index 42h (Bank 4).....	117
9.220	Reserved Register – Index 43h ~ 49h (Bank 4).....	117
9.221	Reserved Register – Index 4Ah (Bank 4).....	117
9.222	Reserved Register – Index 4Bh (Bank 4).....	117

## 1. GENERAL DESCRIPTION

The NCT5532D is a member of Nuvoton's Super I/O product line. The NCT5532D monitors several critical parameters in PC hardware, including power supply voltages, fan speeds and temperatures. In terms of temperature monitoring, the NCT5532D adopts the Current Mode (dual current source) and thermistor sensor approach. The NCT5532D also supports the Smart Fan control system, including "SMART FAN™ I and SMART FAN™ IV, which makes the system more stable and user-friendly.

The NCT5532D provides one high-speed serial communication port (UART), which includes a 16-byte send/receive FIFO, a programmable baud rate generator, complete modem-control capability and a processor interrupt system. The UART supports legacy speeds up to 115.2K bps as well as even higher baud rates of 230K, 460K, or 921K bps to support higher speed modems. The NCT5532D supports keyboard and mouse interface which is 8042-based keyboard controller.

The NCT5532D provides flexible I/O control functions through a set of general purpose I/O (GPIO) ports. These GPIO ports may serve as simple I/O ports or may be individually configured to provide alternative functions.

The NCT5532D supports the Intel® PECC (Platform Environment Control Interface), AMD® SB-TSI interface, AMD® CPU power on sequence, and also partial Intel® Deep Sleep Well glue logic to help customers to reduce the external circuits needed while using Deep Sleep Well function.

The NCT5532D supports two-color LED control to indicate system power states, Consumer IR function for remote control purpose, and also Advanced Power Saving function to further reduce the power consumption.

The configuration registers inside the NCT5532D support mode selection, function enable and disable, and power-down selection. Furthermore, the configurable PnP features are compatible with the plug-and-play feature in Windows, making the allocation of the system resources more efficient than ever.

## 2. FEATURES

### General

- Meet LPC Specification 1.1
- SERIRQ (Serialized IRQ)
- Integrated hardware monitor functions
- Support DPM (Device Power Management), ACPI (Advanced Configuration and Power Interface)
- Programmable configuration settings
- Single 24-MHz or 48-MHz clock input
- Support selective pins of 5 V tolerance

### UART

- One high-speed, 16550-compatible UART with 16-byte send / receive FIFO
- Support RS485
  - Supports auto flow control
- Fully programmable serial-interface characteristics:
  - 5, 6, 7 or 8-bit characters
  - Even, odd or no parity bit generation / detection
  - 1, 1.5 or 2 stop-bit generation
- Internal diagnostic capabilities:
  - Loop-back controls for communications link fault isolation
  - Break, parity, overrun, framing error simulation
- Programmable baud rate generator allows division of clock source by any value from 1 to  $(2^{16} - 1)$
- Maximum baud rate for clock source 14.769 MHz is up to 921K bps. The baud rate at 24 MHz is 1.5 M bps.

### Keyboard Controller

- 8042-based keyboard controller
- Asynchronous access to two data registers and one status register
- Software-compatible with 8042
- Support PS/2 mouse
- Support Port 92
- Support both interrupt and polling modes
- Fast Gate A20 and Hardware Keyboard Reset
- 12MHz operating frequency

### Hardware Monitor Functions

- Two remote temperature sensor inputs
- Programmable threshold temperature to speed fan fully while current temperature exceeds this threshold in the Thermal Cruise™ mode
- Support Current Mode (dual current source) temperature sensing method
- Up to eight voltage inputs (CPUVCORE, VIN2, VIN3, VIN4, 3VCC, AVCC, 3VSB and VBAT)
- Support Smart Fan I and Smart Fan IV
- Two fan-speed monitoring inputs

**PRELIMINARY**

Two fan-speed controls  
Programmable hysteresis and setting points for all monitored items  
Issue SMI# and OVT# (Over-temperature) to activate system protection via GPIO pins  
Nuvoton Health Manager support  
Provide I<sup>2</sup>C master / slave interface to read / write registers

**CIR and IR (Infrared)**

Support IrDA version 1.0 SIR protocol with maximum baud rate up to 115.2K bps  
Support SHARP ASK-IR protocol with maximum baud rate up to 57,600 bps  
Support Consumer IR, including CIRTx and CIRRx

**General Purpose I/O Ports**

Programmable general purpose I/O ports  
Two access channels, indirect (via 2E/2F or 4E/4F) and direct (Base Address) access.

**ACPI Configuration**

Support Glue Logic functions  
Support general purpose Watch Dog Timer functions via GPIO pins

**OnNow Functions**

Keyboard Wake-Up by programmable keys  
Mouse Wake-Up by programmable buttons  
OnNow Wake-Up from all of the ACPI sleeping states (S1-S5)

**PECI Interface**

Support PECI 1.1, 2.0 and 3.0 specification  
Support 2 CPU addresses and 2 domains per CPU address

**AMD SB-TSI Interface**

Support AMD<sup>®</sup> SB-TSI specification

**SMBus Interface**

Support SMBus Slave interface to report Hardware Monitor device data  
Support SMBus Master interface to get thermal data from PCH  
Support SMBus Master interface to get thermal data from MXM module

**AMD<sup>®</sup> CPU Power on Sequence**

Support AMD<sup>®</sup> CPU power on sequence

**Advanced Power Saving**

Advanced Sleep State Control to save motherboard Stand-by power consumption

**Operation voltage**

3.3 voltage

**Package**

64-pin LQFP

Green

4. PIN LAYOUT

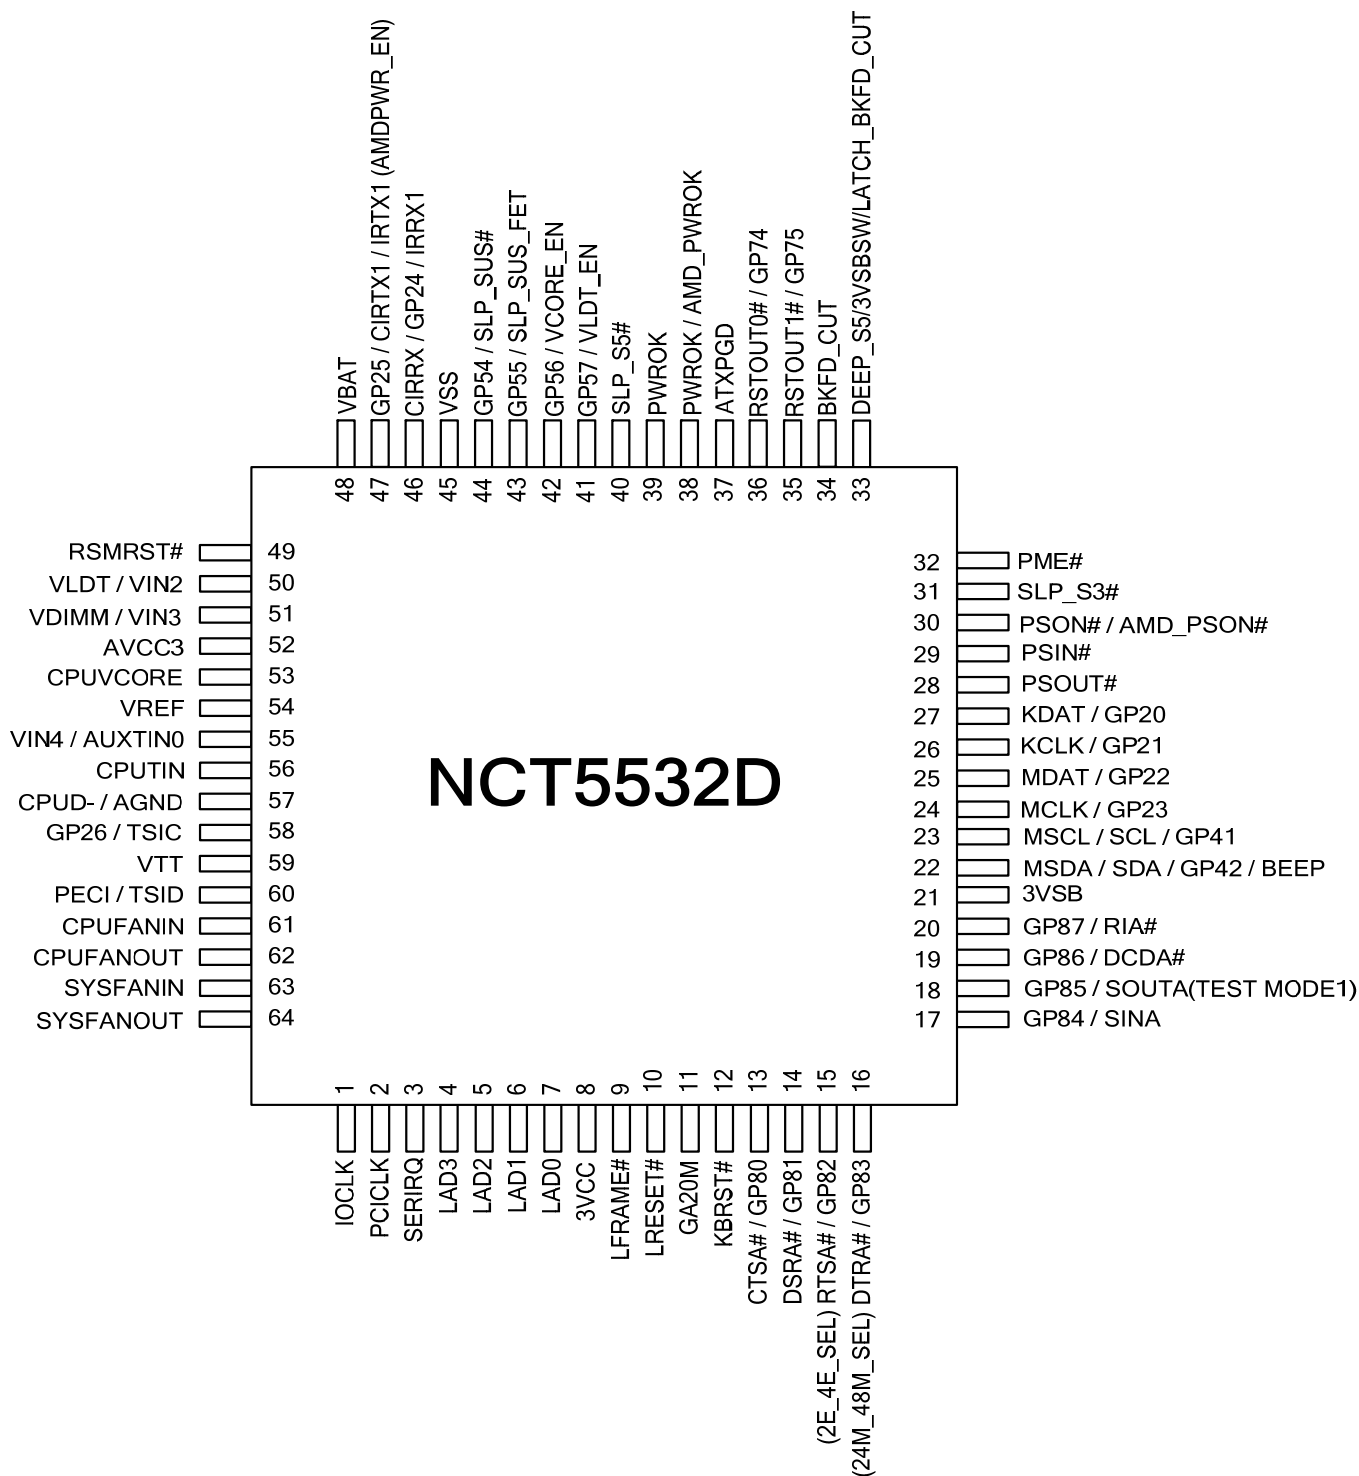

Figure 4-1 NCT5532D Pin Layout

## 5. PIN DESCRIPTION

AOUT	- Analog output pin
AIN	- Analog input pin
IN <sub>tp3</sub>	- 3.3V TTL-level input pin
IN <sub>isp3</sub>	- 3.3V TTL-level, Schmitt-trigger input pin
IN <sub>gp5</sub>	- 5V GTL-level input pin
IN <sub>tp5</sub>	- 5V TTL-level input pin
IN <sub>iscup5</sub>	- 5V TTL-level, Schmitt-trigger, input buffer with controllable pull-up
IN <sub>isp5</sub>	- 5V TTL-level, Schmitt-trigger input pin
IN <sub>tdp5</sub>	- 5V TTL-level input pin with internal pull-down resistor
O <sub>8</sub>	- output pin with 8-mA source-sink capability
OD <sub>8</sub>	- open-drain output pin with 8-mA sink capability
O <sub>12</sub>	- output pin with 12-mA source-sink capability
OD <sub>12</sub>	- open-drain output pin with 12-mA sink capability
O <sub>24</sub>	- output pin with 24-mA source-sink capability
OD <sub>24</sub>	- open-drain output pin with 24-mA sink capability
O <sub>48</sub>	- output pin with 48-mA source-sink capability
OD <sub>48</sub>	- open-drain output pin with 48-mA sink capability
I/O <sub>v3</sub>	- Bi-direction pin with source capability of 6 mA and sink capability of 1 mA
I/O <sub>v4</sub>	- Bi-direction pin with source capability of 6 mA
O <sub>12cu</sub>	- output pin 12-mA source-sink capability with controllable pull-up
OD <sub>12cu</sub>	- open-drain 12-mA sink capability output pin with controllable pull-up

### 5.1 LPC Interface

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
1	IOCLK	I	IN <sub>tp3</sub>	VCC	System clock input, either 24MHz or 48MHz. The actual frequency must be specified in the register. The default value is 48MHz.
32	PME#	O	OD <sub>12</sub>	VSB	Generated PME event.
2	PCICLK	I	IN <sub>tsp3</sub>	VCC	PCI-clock 33-MHz input.
3	SERIRQ	I/O	I/O <sub>12tp3</sub>	VCC	Serialized IRQ input / output.
4-7	LAD[3:0]	I/O	I/O <sub>12tp3</sub>	VCC	These signal lines communicate address, control, and data information over the LPC bus between a host and a peripheral.
9	LFRAME#	I	IN <sub>tsp3</sub>	VCC	Indicates the start of a new cycle or the termination of a broken cycle.
10	LRESET#	I	IN <sub>tsp3</sub>	VCC	Reset signal. It can be connected to the PCIRST# signal on the host.

### 5.2 Serial Port Interface

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
20	RIA#	I	IN <sub>t</sub>	VCC	Ring Indicator. An active-low signal indicates that a ring signal is being received from the modem or the data set.
19	DCDA#	I	Int	VCC	Data Carrier Detection. An active-low signal indicates the modem or data set has detected a data carrier.
18	SOUTA	O	O <sub>8</sub>	VCC	UART A Serial Output. This pin is used to transmit serial data out to the communication link.
17	SINA	I	IN <sub>t</sub>	VCC	Serial Input. This pin is used to receive serial data through the communication link.
16	DTRA#	O	O <sub>8</sub>	VCC	UART A Data Terminal Ready. An active-low signal informs the modem or data set that the controller is ready to communicate.
15	RTSA#	O	O <sub>8</sub>	VCC	UART A Request To Send. An active-low signal informs the modem or data set that the controller is ready to send data.
14	DSRA#	I	IN <sub>t</sub>	VCC	Data Set Ready. An active-low signal indicates the modem or data set is ready to establish a communication link and transfer data to the UART.
13	CTSA#	I	IN <sub>t</sub>	VCC	Clear To Send. This is the modem-control input. The function of these pins can be tested by reading bit 4 of the handshake status register.

### 5.3 KBC Interface

**PRELIMINARY**

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
11	GA20M	O	O <sub>12</sub>	VCC	Gate A20 output. This pin is high after system reset. (KBC P21)
12	KBRST#	O	O <sub>12</sub>	VCC	Keyboard reset. This pin is high after system reset. (KBC P20)
26	KCLK	I/O	IN <sub>tsp5</sub> OD <sub>12</sub>	VSB	Keyboard Clock.
27	KDAT	I/O	IN <sub>tsp5</sub> OD <sub>12</sub>	VSB	Keyboard Data.
24	MCLK	I/O	IN <sub>tsp5</sub> OD <sub>12</sub>	VSB	PS2 Mouse Clock.
25	MDAT	I/O	IN <sub>tsp5</sub> OD <sub>12</sub>	VSB	PS2 Mouse Data.

**5.4 CIR Interface**

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
46	CIRRX	I	IN <sub>tsp5</sub>	VSB	CIR input for long length
47	CIRTX1	O	O <sub>12</sub>	VSB	CIR transmission output

**5.5 Hardware Monitor Interface**

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
50	VIN2	I	AIN	AVCC3	Analog input for voltage measurement (Range: 0 to 2.048 V)
51	VIN3	I	AIN	AVCC3	Analog input for voltage measurement (Range: 0 to 2.048 V)
53	CPUVCORE	I	AIN	AVCC3	Analog input for voltage measurement (Range: 0 to 2.048 V)
54	VREF	O	AOUT	AVCC3	Reference Voltage (around 2.048 V).
55	VIN4 / AUXTIN0	I	AIN	AVCC3	Analog input for voltage measurement (Range: 0 to 2.048V)
56	CPUTIN	I	AIN	AVCC3	The input of temperature sensor 2. It is used for CPU temperature sensing.
61	CPUFANIN	I	IN <sub>tsp5</sub>	VCC	0 to +5 V amplitude fan tachometer input.
62	CPUFANOUT	O	O <sub>12</sub> OD <sub>12</sub>	VCC	PWM duty-cycle signal for fan speed control.
63	SYSFANIN	I	IN <sub>tsp5</sub>	VCC	0 to +5 V amplitude fan tachometer input.

**PRELIMINARY**

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
64	SYSFANOUT	O	AOUT O <sub>12</sub> OD <sub>12</sub>	VCC	PWM duty-cycle signal for fan speed control. DC voltage output for fan speed control.
22	BEEP	O	OD <sub>12</sub>	VSB	Beep function for hardware monitor.

**5.6 Intel® PECI Interface**

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
60	PECI	I/O	I/O <sub>V3</sub>	Vtt	INTEL® CPU PECI interface. Connect to CPU.
59	VTT	I	Power	Vtt	INTEL® CPU Vtt Power.

**5.7 Advanced Configuration & Power Interface**

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
29	PSIN#	I	IN <sub>tp5</sub>	VSB	Panel Switch Input. This pin is active-low with an internal pulled-up resistor.
28	PSOUT#	O	OD <sub>12</sub>	VSB	Panel Switch Output. This signal is used to wake-up the system from S3/S5 state.
49	RSMRST#	O	OD <sub>12</sub>	VRTC	Resume reset signal output.
31	SLP_S3#	I	IN <sub>tp5</sub>	VSB	SLP_S3# input.
40	SLP_S5#	I	IN <sub>tp5</sub>	VSB	SLP_S5# input.
37	ATXPGD	I	IN <sub>tp5</sub>	VSB	ATX power good signal.
30	PSON#	O	OD <sub>12</sub>	VSB	Power supply on-off output.
39	PWROK	O	O <sub>12</sub> OD <sub>12</sub>	VRTC	3VCC PWROK signal.
38	PWROK AMD_PWROK	O	O <sub>12</sub> OD <sub>12</sub>	VRTC	3VCC PWROK signal.
33	3VSBSW	O	OD <sub>24</sub>	VRTC	Switch 3VSB power to memory when in S3 state.
36	RSTOUT0#	O	OD <sub>24</sub>	VSB	PCI Reset Buffer 0. (from pin10)
35	RSTOUT1#	O	O <sub>24</sub> OD <sub>24</sub>	VSB	PCI Reset Buffer 1. (from pin10) This pin default is push-pull output and could be programmed to open-drain output by register Logic Device A CRF7 bit6.

**5.8 Advanced Sleep State Control**

**PRELIMINARY**

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
33	DEEP_S5	O	OD <sub>24</sub>	VRTC	This pin is to control system power for entering “more power saving mode” while at S5.

**5.9 SMBus Interface**

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
23	SCL	I/O	IN <sub>tsp5</sub> OD <sub>12</sub>	VSB	SMBus slave clock.
22	SDA	I/O	IN <sub>tsp5</sub> OD <sub>12</sub>	VSB	SMBus slave bi-directional Data.
23	MSCL	I/O	IN <sub>tsp5</sub> OD <sub>12</sub>	VSB	SMBus master clock.
22	MSDA	I/O	IN <sub>tsp5</sub> OD <sub>12</sub>	VSB	SMBus master bi-directional Data.

**5.10 Power Pins**

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
21	3VSB	I		3VSB	+3.3 V stand-by power supply for the digital circuits.
48	VBAT	I		VBAT	+3 V on-board battery for the digital circuits.
8	3VCC	I		VCC	+3.3 V power supply for driving 3 V on host interface.
52	AVCC3	I		AVCC3	Analog +3.3 V power input. Internally supply power to all analog circuits.
57	CPUD- / AGND	I		CPUD- / AGND	Analog ground. The ground reference for all analog input. Internally connected to all analog circuits. This pin should be connected to ground.
45	VSS	I		VSS	Ground.

**5.11 AMD Power-On Sequence**

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
53	CPUVCOR E	I	AIN	AVCC3	Power sequence group B signal
50	VLDT	I	AIN	AVCC3	Power sequence group C signal
51	VDIMM	I	AIN	AVCC3	Memory power enable
42	VCORE_E N	O	OD <sub>12</sub>	VSB	CPU Vcore power enable
41	VLDT_EN	O	OD <sub>12</sub>	VSB	Hyper transport I/O power enable

**PRELIMINARY**

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
38	AMD_PWR_OK	O	OD <sub>12</sub>	VSB	AMD power on sequence ok signal
30	AMD_PSON#	O	OD <sub>12</sub>	VSB	Power supply on/off output to enable ATX

**5.12 AMD SB-TSI Interface**

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
58	TSIC	O	OD <sub>12</sub>	VCC	AMD SB-TSI clock output.
60	TSID	I/O	IN <sub>tsp3</sub> OD <sub>12</sub>	VCC	AMD SB-TSI data input / output.

**5.13 Dual Voltage Control**

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
34	BKFD_CUT	O	OD <sub>12</sub>	VSB	Power distribution control (When switching between main and standby regulators) for system transition into and out of the S3 sleep state.
33	LATCH_BKFD_CUT	O	O <sub>12</sub>	VRTC	Power distribution control (When switching between main and standby regulators) for system transition into and out of the S5 sleep state.

**5.14 DSW**

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
44	SLP_SUS#	I	IN <sub>tp5</sub>	VSB	This pin connects to SLP_SUS# in CPT PCH
43	SLP_SUS_FET	O	OD <sub>12</sub>	VSB	This pin connects to VSB power switch

**5.15 IR**

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
46	IRRX1	I	IN <sub>tsp5</sub>	VSB	IR Receiver input.
47	IRTX1	O	O <sub>12</sub>	VSB	IR Transmitter output.

**5.16 General Purpose I/O Port**

**5.16.1 GPIO-2 Interface**

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
-----	--------	-----	-------------	------------	-------------

**PRELIMINARY**

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
27	GP20	I/O	IN <sub>tsp5</sub> O <sub>12</sub> OD <sub>12</sub>	VSB	General-purpose I/O port 2 bit 0.
26	GP21	I/O	IN <sub>tsp5</sub> O <sub>12</sub> OD <sub>12</sub>	VSB	General-purpose I/O port 2 bit 1.
25	GP22	I/O	IN <sub>tsp5</sub> O <sub>12</sub> OD <sub>12</sub>	VSB	General-purpose I/O port 2 bit 2.
24	GP23	I/O	IN <sub>tsp5</sub> O <sub>12</sub> OD <sub>12</sub>	VSB	General-purpose I/O port 2 bit 3.
46	GP24	I/O	IN <sub>tsp5</sub> O <sub>12</sub> OD <sub>12</sub>	VSB	General-purpose I/O port 2 bit 4.
47	GP25	I/O	IN <sub>tp5</sub> O <sub>12</sub> OD <sub>12</sub>	VSB	General-purpose I/O port 2 bit 5.
58	GP26	I/O	IN <sub>tp5</sub> O <sub>12</sub> OD <sub>12</sub>	VSB	General-purpose I/O port 2 bit 6.

**5.16.2 GPIO-4 Interface**

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION

6. GLUE LOGIC

6.1 ACPI Glue Logic

Table 6-1 Pin Description

SYMBOL	PIN	DESCRIPTION
SLP_S5#	40	SLP_S5# input.
PWROK	39	This pin generates the PWROK signals while 3VCC is present.
ATXPGD	37	ATX power good input signal. It is connected to the PWROK signal from the power supply for PWROK / PWRGD generation. The default is enabled.
RSMRST#	49	The RSMRST# signal is a reset output and is used as the VSB power on reset signal for the South Bridge. When the NCT5532D detects the 3VSB voltage rises to "V1", it then starts a delay – "t1" before the rising edge of RSMRST# asserting. If the 3VSB voltage falls below "V2", the RSMRST# de-asserts immediately.

Figure 6-1 RSMRST#

Figure 6-2 PWROK

t9	SLP_S3# active to 3VSBSW# active	0	30	mS
t10	3VCC active to 3VSBSW# inactive	90	142	mS
t11	SLP_S3# inactive to PSON# active	0	80	nS
t12	SLP_S3# active to PSON# inactive	15	45	mS
t13	SLP_S3# minimal Low Time	40	-	mS

### 6.4 PSON# Block Diagram

The PSON# function controls the main power on/off. The main power is turned on when PSON# is low. Please refer to the figure below.

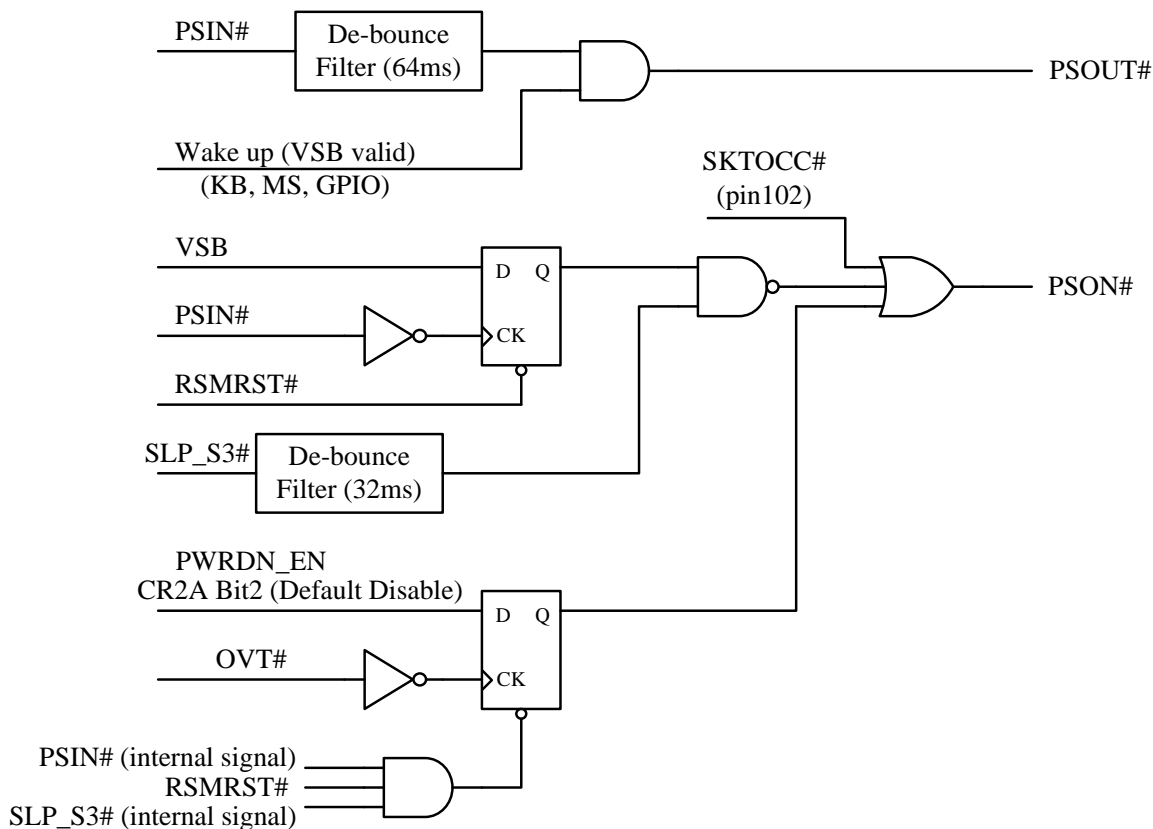

Figure 6-6 PSON# Block Diagram

**6.5 PWROK**

PWROK Signal indicates the main power (VCC Power) is valid. Besides, valid PWROK signal also requires the following conditions, as shown in the figure below.

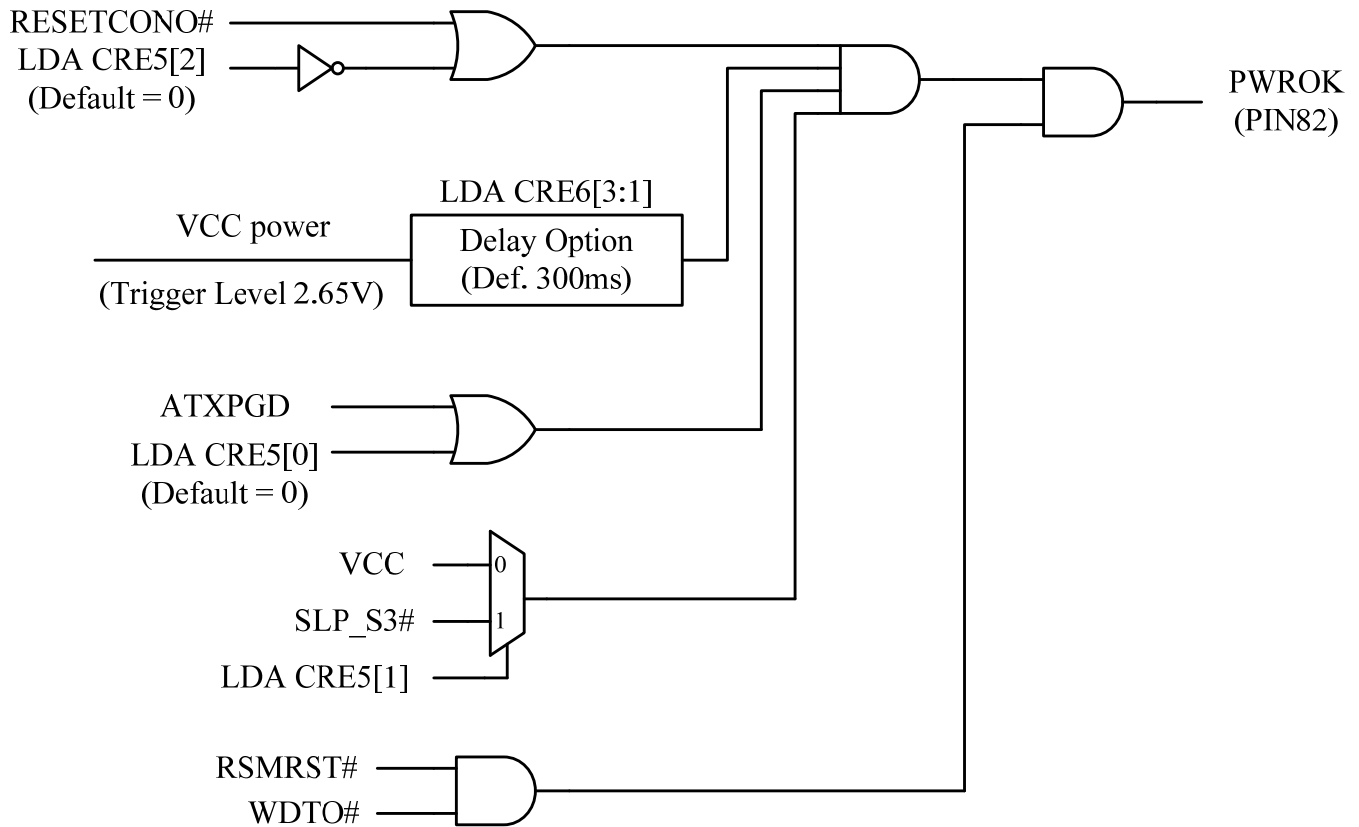

Figure 6-7 PWROK Block Diagram

### 6.6 Front Panel LEDs

NCT5532D supports two LED control pins – GRN\_LED and YLW\_LED.

For dual-color LED application:

- (1) GRN\_LED pin is connected to a 470ohm resistor to 5VSB, and the cathode of the green LED and the anode of the yellow LED.
- (2) YLW\_LED pin is connected to a 470ohm resistor to 5VSB, and the cathode of the yellow LED and the anode of the green LED.

Figure 6-8 Illustration of Dual Color LED application

GRN\_LED and YLW\_LED pins are designed to show currently power states. There are Manual Mode and Automatic Mode:

#### 6.6.1 Automatic Mode

Power state is S0 or S1: GRN\_LED will be asserted by default.

Power state is S3: YLW\_LED will be asserted by default.

Power state is S4 or S5: Both GRN\_LED and YLW\_LED will be de-asserted by default.

AUTO_EN	GRN_LED_RST (YLW_LED_RST)	Pwr State	SLP_S3#	SLP_S5#	GRN_LED	YLW_LED
1	X	S0,S1	1	1	GRN_BLK_FREQ	HIGH-Z
1	X	S3	0	1	HIGH-Z	YLW_BLK_FREQ
1	X	S4,S5	X	0	HIGH-Z	HIGH-Z

1	1	DEEP_S3	HIGH-Z	HIGH-Z
0	X	S0~S5	S0~S5 behavior	S0~S5 behavior

### 6.7 Advanced Sleep State Control (ASSC) Function

Advanced Sleep State Control (ASSC) Function is used to control the system power at S3 or S5 state. The purpose of this function is to provide a method to reduce power consumption at S3 or S5 state. This function is disabled by default. When VCC power is first supplied, BIOS can program the register to enable ASSC Function. The register is powered by 3VSB\_IO and some is powered by VBAT. The related registers are located at Logic Device 16 CRE0h ~ CRE3h.

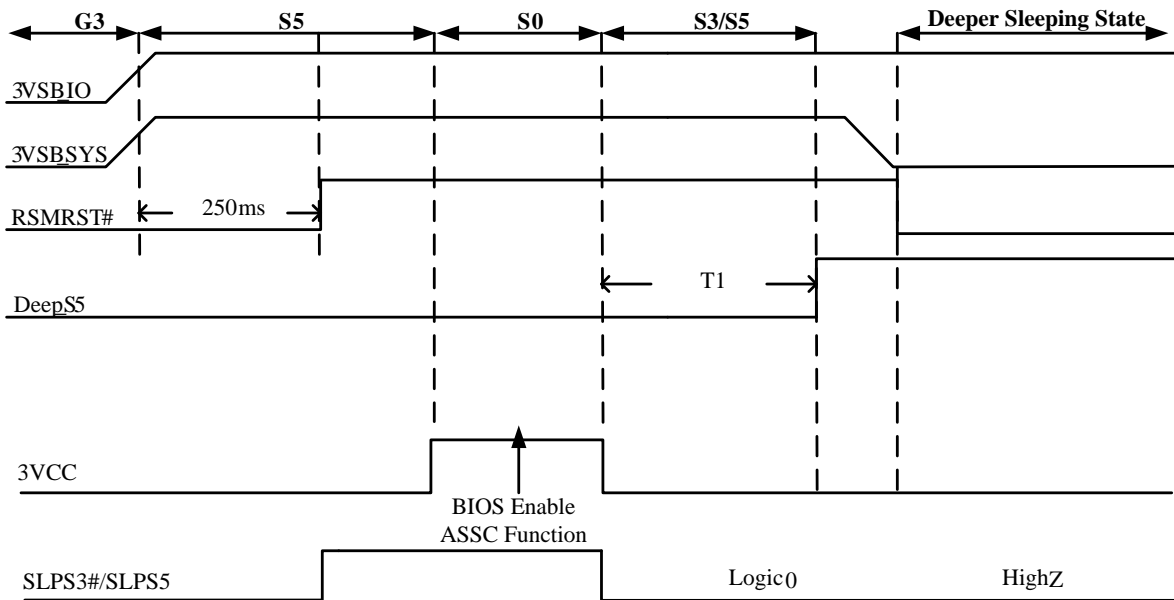

Figure 6-10 ASSC Application Diagram

#### 6.7.1 When ASSC is disabled

When ASSC is disabled, ACPI function is as same as the normal ACPI behavior.

6.7.2 When ASSC is enabled (Enter into Deeper Sleeping State)

When the first time AC plug in and enter into S0 State, BIOS can enable ASSC Function (DeepS3 or DeepS5), when the system enters S3/S5 state, the pin DEEP\_S5 will be asserted after pre configuration delay time (power\_off\_dly\_time, LD16 CRE2) to make the system entering the “Deeper Sleeping State (DSS)” where system’s VSB power is cut off. When pin DEEP\_S5 asserts, the pin RSMRST# will de-assert by detecting PSOUT# signal (monitor 3VSB SYS Power).

6.7.3 When ASSC is enabled (Exit Deeper Sleeping State)

When any Wakeup Event (PSIN#, KB MS Wakeup, CIR wakeup, GPIO Wakeup) happened, pin DEEP\_S5 will be de-asserted to turn on the VSB power to the system. The pin RSMRST# will de-assert when 3VSB\_SYS power reach valid voltage. And then the pin PSOUT# will issue a low pulse (T3) turn on the system after T2 time

**PRELIMINARY**

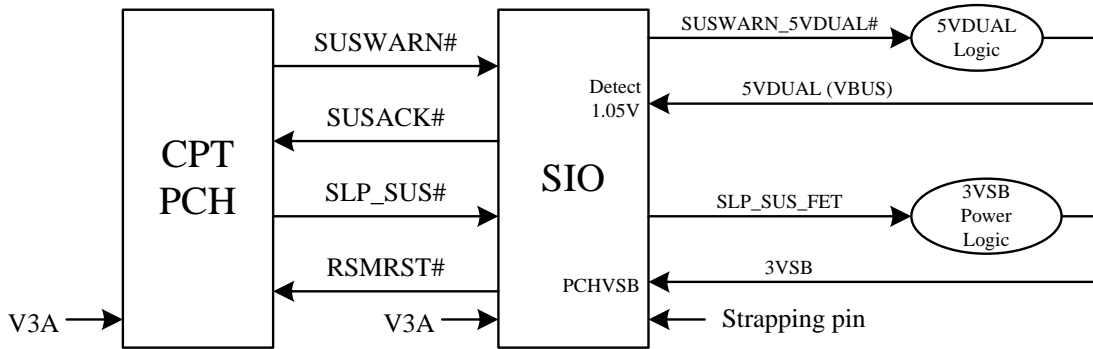

(wakeup delay time, LD16 CRE0). The PSOUT# low pulse is also programmable (LD16 CRE1). The T4 time is the delay from Deep\_S5 ds-assert to Deeo\_S5#\_DELAY de-assert.

**6.7.4 SLP\_S5#\_LATCH Control Function**

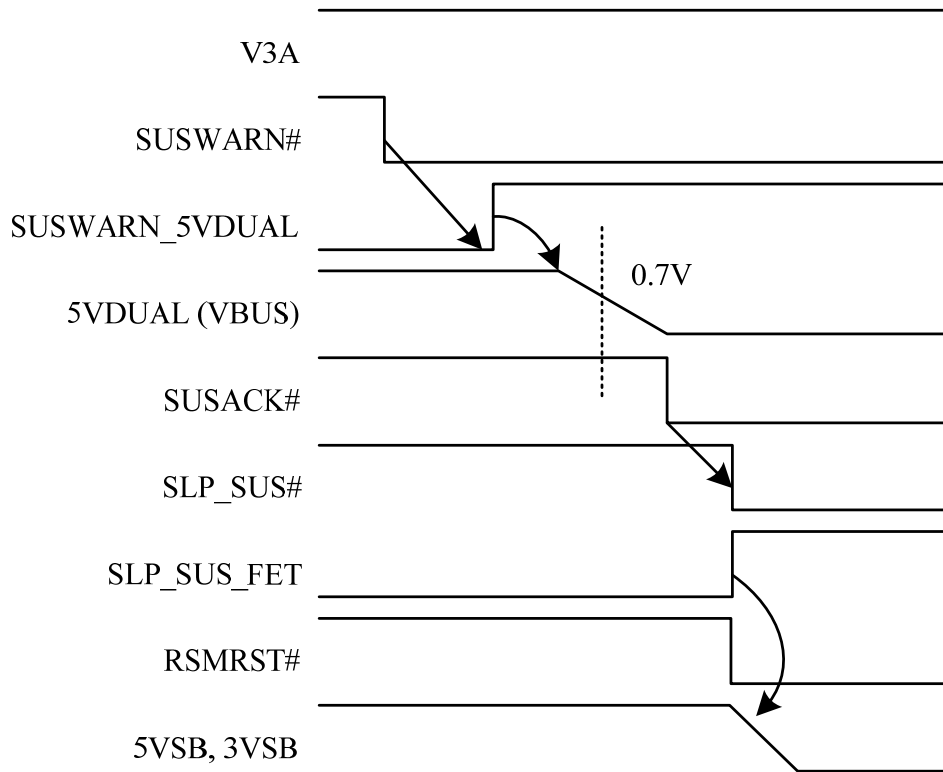

SLP\_S5#\_LATCH control signal is similar to SLPS5# signal. When System is at S0 ~ S5 state, SLP\_S5#\_LATCH follows the SLPS5# signal. When system is at DeepS5 State, SLP\_S5#\_LATCH will keep low state till system returns to S0 state. When system is at DeepS3 State, SLP\_S5#\_LATCH will keep high till system returns to S0 state. Please see the following timing diagram:

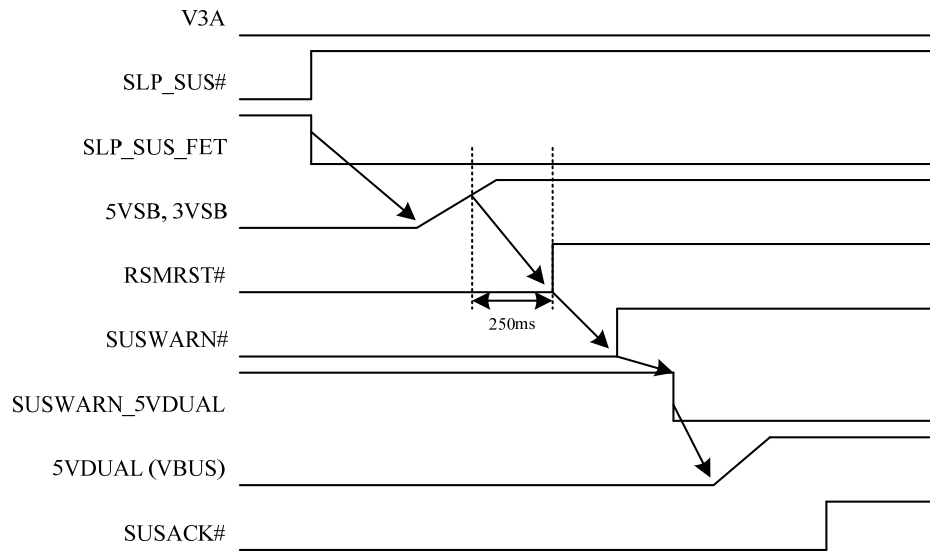

6.8 Intel DSW Function

6.8.1 Enter DSW State timing diagram

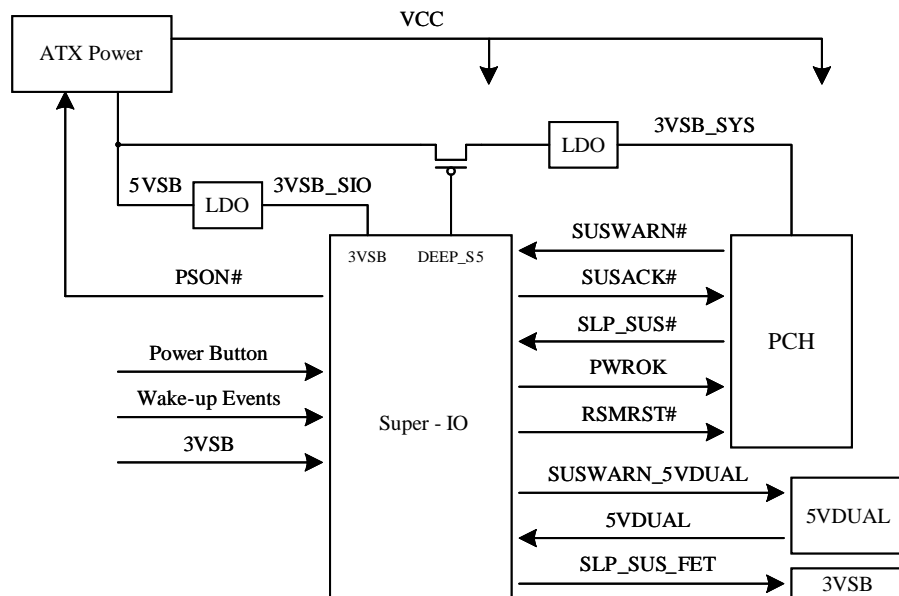

6.8.2 Exit DSW State timing diagram

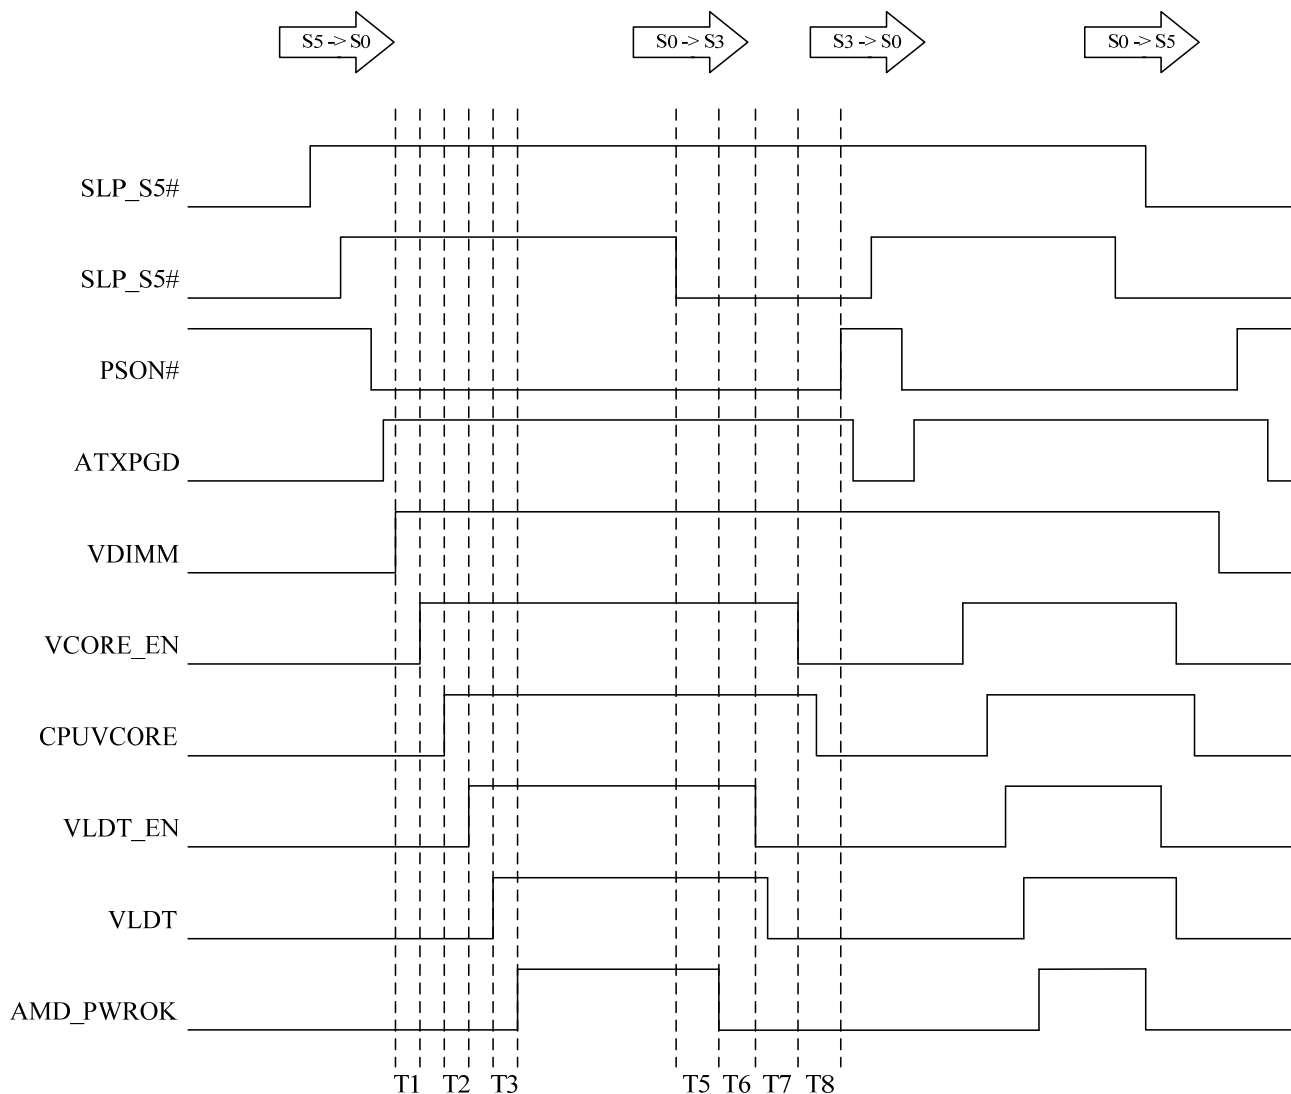

6.8.3 Application Circuit

The NCT5532D not only provides SIO Deep S5/S3 function, but also Intel DSW function. The application circuit should follow the guide below:

### 6.9 AMD Power-On Sequence

The NCT5532D supports new AMD power on sequence base on ACPI power on sequence , therefore , user can choose which architecture by set the strapping pin98 . If pin98 is 0, only ACPI power on sequence is set , otherwise, AMD power on sequence is combined with ACPI, user can set CR2F[5] to get the same condition. To make sure CR2B[4]:GP34\_SEL and CR2B[0]:GP30\_SEL are "0" before running the sequence, because they are ATXPGD and SLP\_S5# pin select.

When S0->S3 or S0->S5, we support two kinds of power off sequence. One is non\_level detect: it means VCORE\_EN will pull low as long as about 10~15ms after VLDT\_EN pull low and PSON will pull high as long as about 10~15ms after VCORE\_EN pull low. Two, level detect, means VCORE\_EN will pull low depend on delay time and pre-power group VLDT\_IN, and PSON will pull high depend on pre-power group (VDIMM\_IN, ATXPGD), too. User can set CR27[1] to choose two condition and its default is "0" (level detect).

**PRELIMINARY**

Timing Parameters

Parameter	Description	Min.	Typ.	Max.	Unit
T1	Period of VDIMM rises to 0.7V to VCORE_EN assertion	10		15	ms
T2	Period of CPUVCORE rises to 0.7V to VLDT_EN assertion	10		15	ms
T3	Period of VLDT_IN rises to 0.7V to AMD_PWROK assertion	10		15	ms
T4	Period of SLP_S3# deassertion to AMD_PWROK deassertion	10		50	ms
T5	Period of CPUPWRGD deassertion to VLDT_EN deassertion	10		15	ms
T6	Period of VLDT_EN deassertion to VCORE_EN deassertion	10		15	ms
T7	Period of VCORE_EN deassertion to PSON# deassertion	10		15	ms

VDDA: 2.5V (not controlled by SIO)

VDIMM: DDR 1.8V, DDR3 1.5V (not controlled by SIO)

VLDT: 1.2V

VCORE: 0.8V ~ 1.55V

To support AMD power on sequence , we add some Pinout as VLDT\_EN , VCORE\_EN , VLDT , VDIMM . The sequence is follow the figure above . CPU and NB must conform to the SPEC or else the SIO will suspend at the sequence .

## 7. CONFIGURATION REGISTER ACCESS PROTOCOL

The NCT5532D uses a special protocol to access configuration registers to set up different types of configurations. The NCT5532D has a total of 16 Logical Devices (from Logical Device 1 to Logical Device 16 with the exception of Logical Device 0, 1, 4, C, 10, 11, 12, 13, 14 & 15 for backward compatibility) corresponding to fourteen individual functions: UART A (Logical Device 2), IR (Logical Device 3), Keyboard Controller (Logical Device 5), CIR (Logical Device 6), GPIO7 & 8 (Logical Device 7), WDT1 (Logical Device 8), GPIO2, 4, 5, 7 & 8 (Logical Device 9), ACPI (Logical Device A), Hardware Monitor & Front Panel LED (Logical Device B), WDT1 (Logical Device D), CIRWAKEUP (Logical Device E), GPIO (Logical Device F), and Deep Sleep (Logical Device 16).

It would require a large address space to access all of the logical device configuration registers if they were mapped into the normal PC address space. The NCT5532D, then, maps all the configuration registers through two I/O addresses (2Eh/2Fh or 4Eh/4Fh) set at power on by the strap pin 2E\_4E\_SEL. The two I/O addresses act as an index/data pair to read or write data to the Super I/O. One must write an index to the first I/O address which points to the register and read or write to the second address which acts as a data register.

An extra level of security is added by only allowing data updates when the Super I/O is in a special mode, called the Extended Function Mode. This mode is entered by two successive writes of 87h data to the first I/O address. This special mode ensures no false data can corrupt the Super I/O configuration during a program runaway.

There are a set of global registers located at index 0h – 2Fh, containing information and configuration for the entire chip.

The method to access the control registers of the individual logical devices is straightforward. Simply write the desired logical device number into the global register 07h. Subsequent accesses with indexes of 30h or higher are directly to the logical device registers.

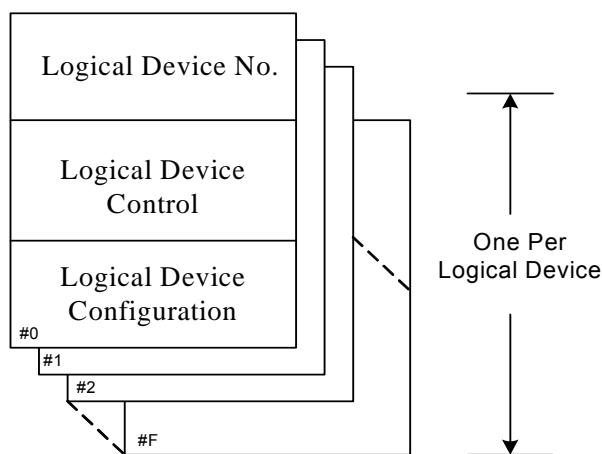

Figure 7-1 Structure of the Configuration Register

**PRELIMINARY**

Table 7-1 Devices of I/O Base Address

LOGICAL DEVICE NUMBER	FUNCTION	I/O BASE ADDRESS
0	Reserved

13	Reserved	
14	Reserved	
15	Reserved	
16	Deep Sleep	Reserved

## 7.1 Configuration Sequence

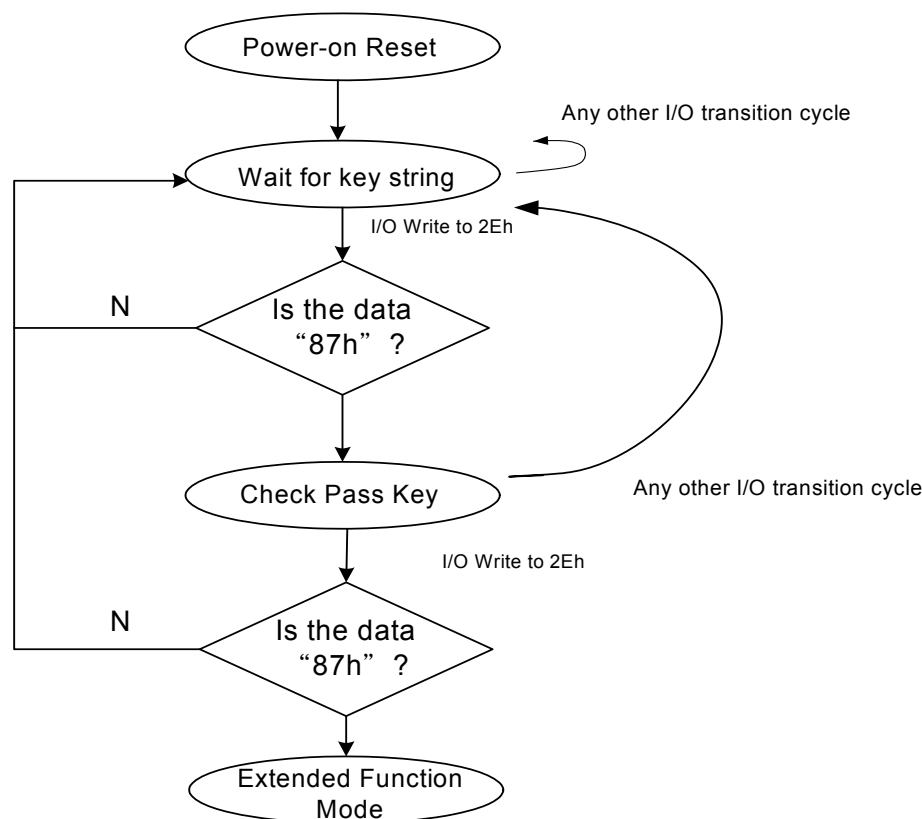

Figure 7-2 Configuration Register

To program the NCT5532D configuration registers, the following configuration procedures must be followed in sequence:

- (1). Enter the Extended Function Mode.
- (2). Configure the configuration registers.
- (3). Exit the Extended Function Mode.

### 7.1.1 Enter the Extended Function Mode

To place the chip into the Extended Function Mode, two successive writes of 0x87 must be applied to Extended Function Enable Registers (EFERs, i.e. 2Eh or 4Eh).

### 7.1.2 Configure the Configuration Registers

The chip selects the Logical Device and activates the desired Logical Devices through Extended Function Index Register (EFIR) and Extended Function Data Register (EFDR). The EFIR is located at the same address as the EFER, and the EFDR is located at address (EFIR+1).

First, write the Logical Device Number (i.e. 0x07) to the EFIR and then write the number of the desired Logical Device to the EFDR. If accessing the Chip (Global) Control Registers, this step is not required.

**PRELIMINARY**

Secondly, write the address of the desired configuration register within the Logical Device to the EFIR and then write (or read) the desired configuration register through the EFDR.

**7.1.3 Exit the Extended Function Mode**

To exit the Extended Function Mode, writing 0xAA to the EFER is required. Once the chip exits the Extended Function Mode, it is in the normal running mode and is ready to enter the configuration mode.

**7.1.4 Software Programming Example**

The following example is written in Intel 8086 assembly language. It assumes that the EFER is located at 2Eh, so the EFIR is located at 2Eh and the EFDR is located at 2Fh. If the HEFRAS (CR[26h] bit 6 showing the value of the strap pin at power on) is set, 2Eh can be directly replaced by 4Eh and 2Fh replaced by 4Fh.

This example programs the configuration register F0h (clock source) of logical device 1 (UART A) to the value of 3Ch (24MHz). First, one must enter the Extended Function Mode, then setting the Logical Device Number (Index 07h) to 01h. Then program index F0h to 3Ch. Finally, exit the Extended Function Mode.

```

;-----
; Enter the Extended Function Mode
;-----
MOV  DX, 2EH

;
MOV  DX, 2EH
MOV  AL, F0H
OUT  DX, AL      ; select CRF0
MOV  DX, 2FH
MOV  AL, 3CH
OUT  DX, AL      ; update CRF0 with value 3CH

;-----
; Exit the Extended Function Mode
;-----
MOV  DX, 2EH
MOV  AL, AAH
OUT  DX, AL

```

## 8. HARDWARE MONITOR

### 8.1 General Description

The NCT5532D monitors several critical parameters in PC hardware, including power supply voltages, fan speeds, and temperatures, all of which are very important for a high-end computer system to work stably and properly. In addition, proprietary hardware reduces the amount of programming and processor intervention to control cooling fan speeds, minimizing ambient noise and maximizing system temperature and reliability.

The NCT5532D can simultaneously monitor all of the following inputs:

- 8 analog voltage inputs (5 internal voltages CPUVCORE, VBAT, 3VSB, 3VCC and AVCC; 3 external voltage inputs)
- 2 fan tachometer inputs
- 2 remote temperatures, using either a thermistor or from the CPU thermal diode (voltage or Current Mode measurement method)

These inputs are converted to digital values using the integrated, eight-bit analog-to-digital converter (ADC).

In response to these inputs, the NCT5532D can generate the following outputs:

- 2 PWM (pulse width modulation) and one DC fan outputs for the fan speed control
- SMI# via GPIO
- OVT# signals for system protection events via GPIO

The NCT5532D provides hardware access to all monitored parameters through the LPC or I<sup>2</sup>C interface and software access through application software, such as Nuvoton's Hardware Doctor™, or BIOS.

The rest of this section introduces the various features of the NCT5532D hardware-monitor capability. These features are divided into the following sections:

- Access Interfaces
- Analog Inputs
- Fan Speed Measurement and Control
- Smart Fan Control
- SMI# interrupt mode
- OVT# interrupt mode
- Registers and Value RAM

### 8.2 Access Interfaces

The NCT5532D provides two interfaces, LPC and I<sup>2</sup>C, for the microprocessor to read or write the internal registers of the hardware monitor.

### 8.3 LPC Interface

The internal registers of the hardware monitor block are accessible through two separate methods on the LPC bus. The first set of registers, which primarily enable the block and set its address in the CPU I/O address space are accessed by the Super I/O protocol described in Chapter 7 at address 2Eh/2Fh or 4Eh/4Fh. The bulk of the functionality and internal registers of this block are accessed from an index/data pair of CPU I/O addresses. The standard locations are usually 295h/296h and are set by CR[60h]&CR[61h] accessed using the Super I/O protocol as described in Chapter 7.

Due to the number of internal register, it is necessary to separate the register sets into “banks” specified by register 4Eh. The structure of the internal registers is shown in the following figure.

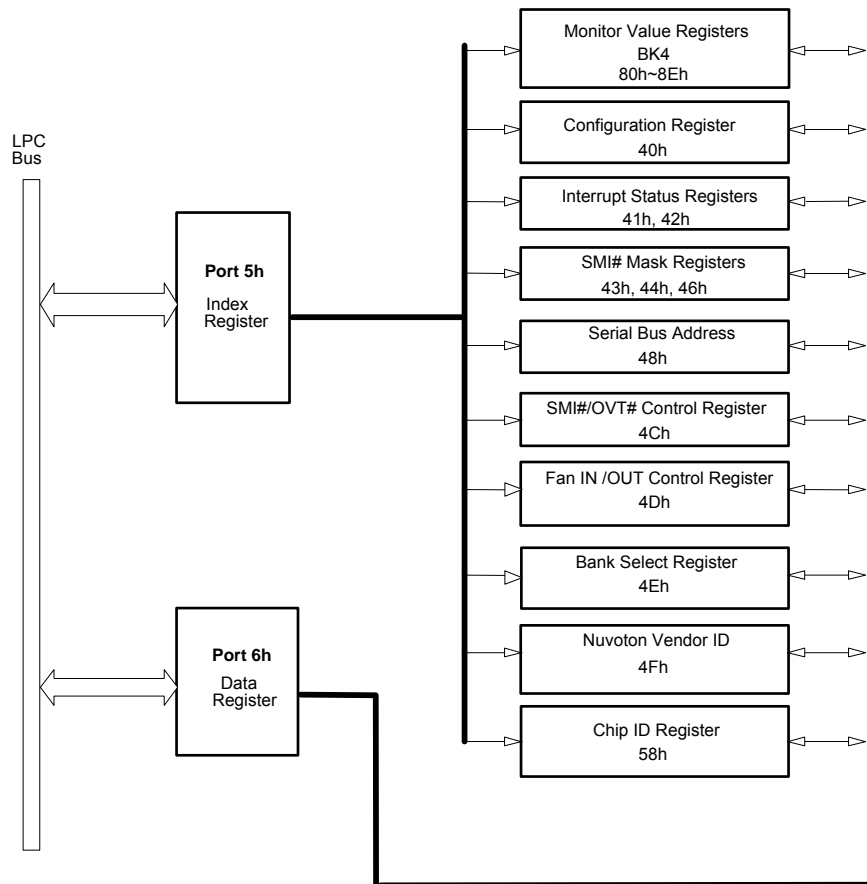

Figure 8-1 LPC Bus' Reads from / Write to Internal Registers

### 8.4 I<sup>2</sup>C interface

The I<sup>2</sup>C interface is a second, serial port into the internal registers of the hardware monitor function block. The interface is totally compatible with the industry-standard I<sup>2</sup>C specification, allowing external components that are also compatible to read the internal registers of the NCT5532D hardware monitor and control fan speeds. The address of the I<sup>2</sup>C peripheral is set by the register located at index 48h (which is accessed by the index/data pair at I/O address typically at 295h/296h)

The two timing diagrams below illustrate how to use the I<sup>2</sup>C interface to write to an internal register and how to read the value in an internal register, respectively.

(a) Serial bus write to internal address register followed by the data byte

Figure 8-2 Serial Bus Write to Internal Address Register Followed by the Data Byte

(b) Serial bus read from a register

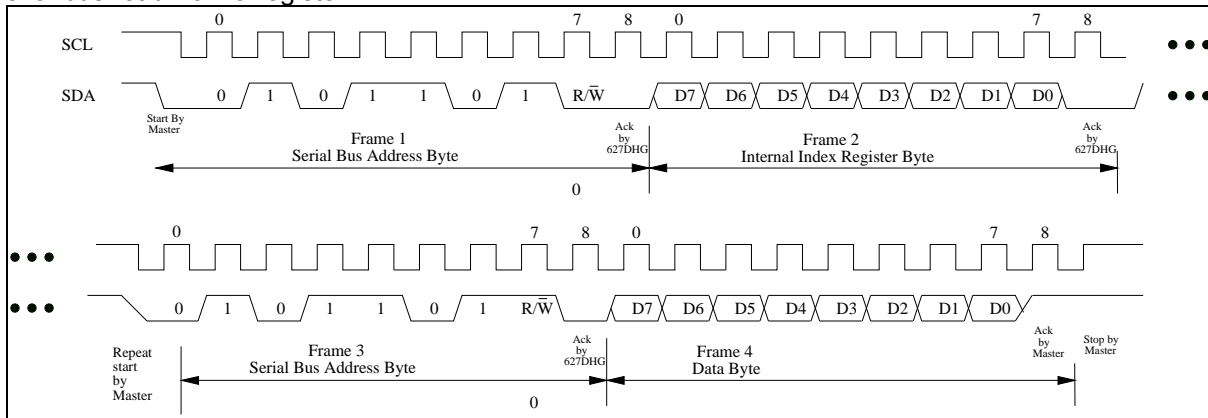

Figure 8-3 Serial Bus Read from Internal Address Register

### 8.5 Analog Inputs

The 8 analog inputs of the hardware monitor block connect to an 8-bit Analog to Digital Converter (ADC) and consist of 4 general-purpose inputs connected to external device pins and 4 internal signals connected to the power supplies (AVCC, VBAT, 3VSB and 3VCC). All inputs are limited to a maximum voltage of 2.048V due to an internal setting of 8mV LSB (256 steps x 8mV = 2.048V). All inputs to the ADC must limit the maximum voltage by using a voltage divider. The power supplies have internal resistors, while the external pins require outside limiting resistors as described below. The figure shown below is an illustration.

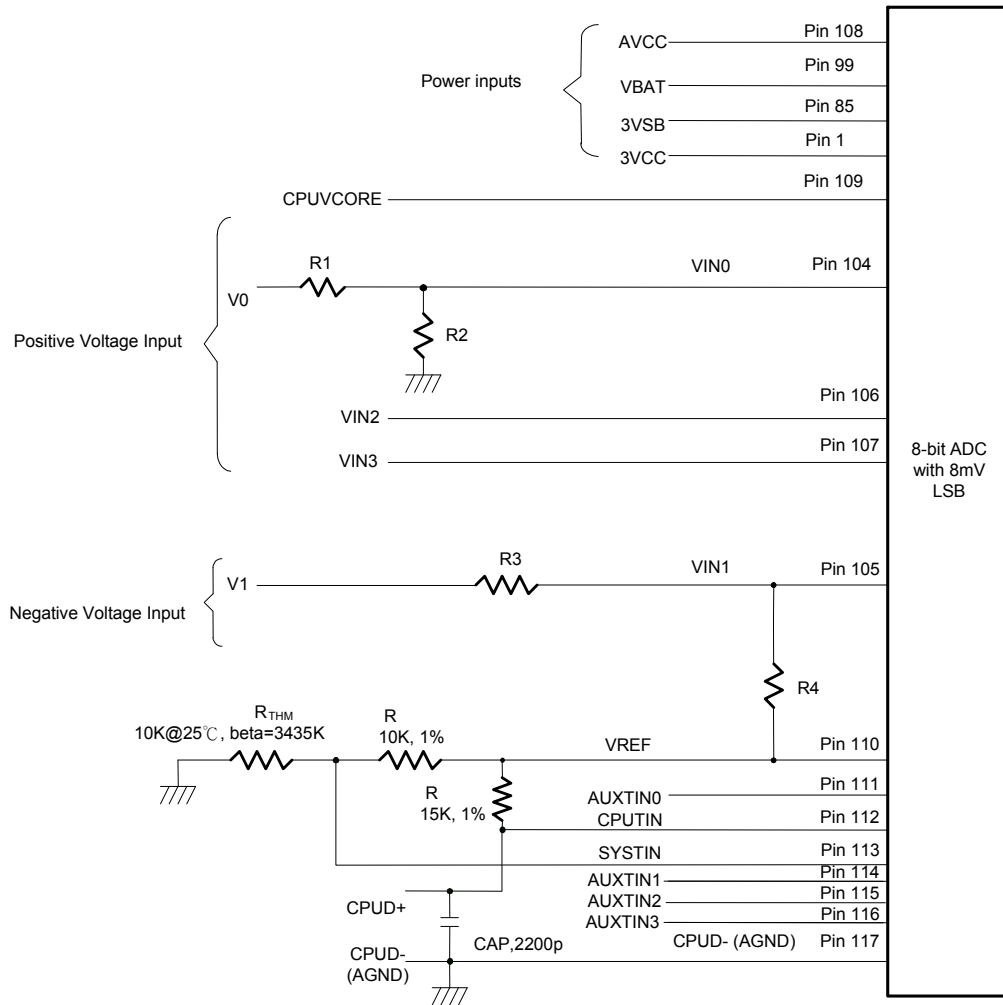

Figure 8-4 Analog Inputs and Application Circuit of the NCT5532D

As illustrated in the figure above, other connections may require some external circuits. The rest of this section provides more information about voltages outside the range of the 8-bit ADC, CPU Vcore voltage detection, and temperature sensing.

**PRELIMINARY**

**8.5.1 Voltages Over 2.048 V or Less Than 0 V**

Input voltages greater than 2.048 V should be reduced by an external resistor divider to keep the input voltages in the proper range. For example, input voltage  $V_0$  (+12 V) should be reduced before it is connected to VIN0 according to the following equation:

$$VIN0 = V_0 \times \frac{R_2}{R_1 + R_2}$$

R1 and R2 can be set to 56 KΩ and 10 KΩ, respectively, to reduce  $V_0$  from +12 V to less than 2.048 V.

All the internal inputs of the ADC, AVCC, VBAT, 3VSB and 3VCC utilize an integrated voltage divider with both resistors equal to 34KΩ, yielding a voltage one half of the power supply. Since one would expect a worst-case 10% variation or a 3.63V maximum voltage, the input to the ADC will be 1.815V, well within the maximum range.

$$V_{in} = VCC \times \frac{34K\Omega}{34K\Omega + 34K\Omega} \cong 1.65V, \text{ where } VCC \text{ is set to } 3.3V$$

The CPUVCORE pin feeds directly into the ADC with no voltage divider since the nominal voltage on this pin is only 1.2V.

Negative voltages are handled similarly, though the equation looks a little more complicated. For example, negative voltage  $V_1$  (-12V) can be reduced according to the following equation:

$$VIN1 = (V_1 - 2.048) \times \frac{R_4}{R_3 + R_4} + 2.048, \text{ where } V_1 = -12$$

R3 and R4 can be set to 232 KΩ and 10 KΩ, respectively, to reduce negative input voltage  $V_1$  from -12 V to less than 2.048 V. Note that R4 is referenced to VREF, or 2.048V instead of 0V to allow for more dynamic range. This is simply good analog practice to yield the most precise measurements.

Both of these solutions are illustrated in the figure above.

**8.5.2 Voltage Data Format**

The data format for voltage detection is an eight-bit value, and each unit represents an interval of 8 mV.

$$\text{Detected Voltage} = \text{Reading} * 0.008 \text{ V}$$

If the source voltage was reduced by a voltage divider, the detected voltage value must be scaled accordingly.

**8.5.2.1. Voltage Reading**

NCT5532D has 9 voltage reading:

	<b>CPUVCORE</b>	<b>AVCC</b>	<b>3VCC</b>	<b>VIN2</b>	<b>VIN3</b>
<b>Voltage reading</b>	Bank4, Index80	Bank4, Index82	Bank4, Index83	Bank4, Index8C	Bank4, Index8D
	<b>3VSB</b>	<b>VBAT</b>	<b>VTT</b>	<b>VIN4</b>	
<b>Voltage reading</b>	Bank4, Index87	Bank4, Index88	Bank4, Index89	Bank4, Index86	

**8.5.3 Temperature Data Format**

The data format for sensors CPUTIN and AUXTIN0 is 9-bit, two's-complement. This is illustrated in the table below. There are two sources of temperature data: external thermistors or thermal diodes.

Table 8-1 Temperature Data Format

TEMPERATURE	8-BIT DIGITAL OUTPUT		9-BIT DIGITAL OUTPUT	
	8-BIT BINARY	8-BIT HEX	9-BIT BINARY	9-BIT HEX
+125°C	0111,1101	7Dh	0,1111,1010	0FAh
+25°C	0001,1001	19h	0,0011,0010	032h
+1°C	0000,0001	01h	0,0000,0010	002h
+0.5°C	-	-	0,0000,0001	001h
+0°C	0000,0000	00h	0,0000,0000	000h
-0.5°C	-	-	1,1111,1111	1FFh
-1°C	1111,1111	FFh	1,1111,1110	1FFh
-25°C	1110,0111	E7h	1,1100,1110	1Ceh
-55°C	1100,1001	C9h	1,1001,0010	192h

**8.5.3.1. Monitor Temperature from Thermistor**

External thermistors should have a  $\beta$  value of 3435K and a resistance of 10 K $\Omega$  at 25°C. As illustrated in the schematic above, the thermistor is connected in series with a 10-K $\Omega$  resistor and then connects to VREF. The configuration registers to select a thermistor temperature sensor and the measurement method are found at Bank 0, index 59h, 5Dh, and 5Eh.

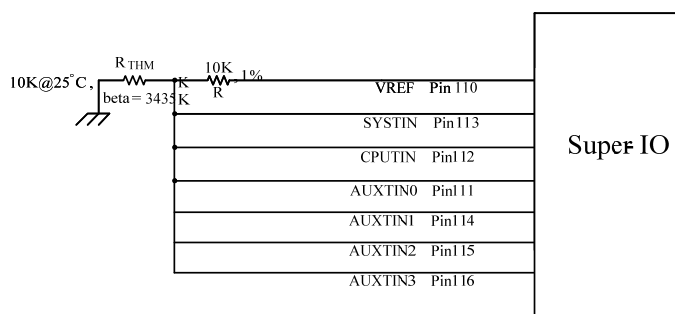

Figure 8-5 Monitoring Temperature from Thermistor

**8.5.3.2. Monitor Temperature from Thermal Diode (Voltage Mode)**

The thermal diode D- pin is connected to AGND, and the D+ pin is connected to the temperature sensor pin in the NCT5532D. A 15-K $\Omega$  resistor is connected to VREF to supply the bias current for the diode, and the 2200-pF, bypass capacitor is added to filter high-frequency noise. The configuration registers to select a thermal diode temperature sensor and the measurement method are found at Bank 0, index 5Dh, and 5Eh.

PRELIMINARY

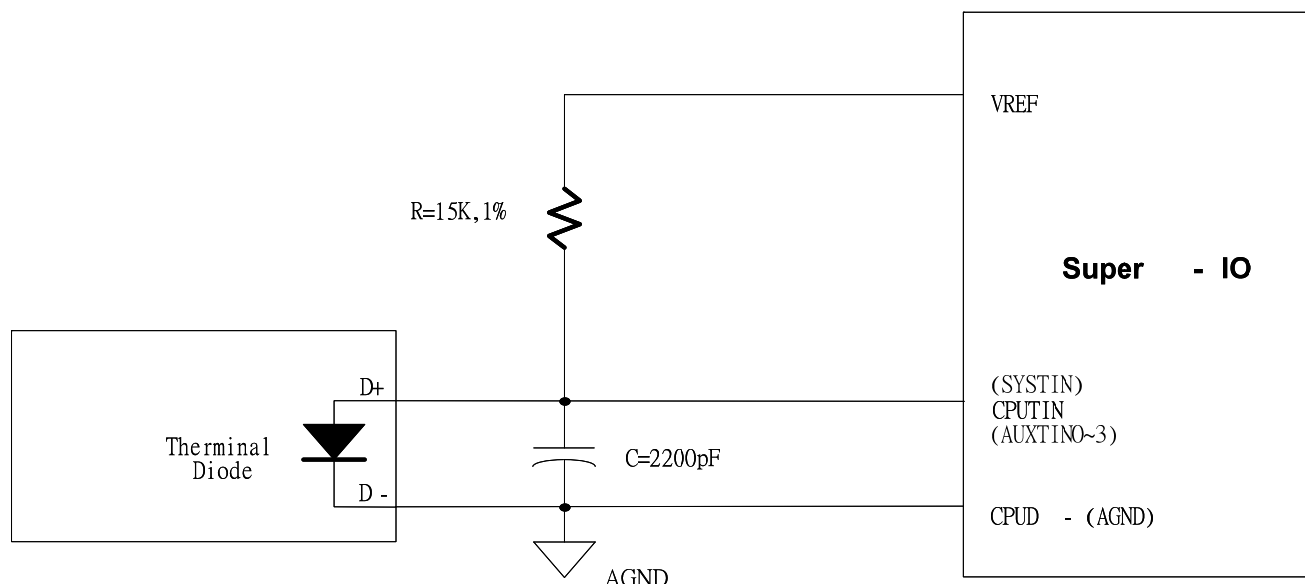

Figure 8-6 Monitoring Temperature from Thermal Diode (Voltage Mode)

**8.5.3.3. Monitor Temperature from Thermal Diode (Current Mode)**

The NCT5532D can also sense the diode temperature through Current Mode and the circuit is shown in the following figure.

Figure 8-7 Monitoring Temperature from Thermal Diode (Current Mode)

The pin of processor D- is connected to CPUD- and the pin D+ is connected to temperature sensor pin in the NCT5532D. A bypass capacitor C=2200pF should be added to filter the high frequency noise. The configuration registers to select a thermal diode temperature sensor and the measurement method are found at Bank 0, index 5Dh and 5Eh.

**8.5.3.4. Temperature Reading**

NCT5532D has 6 temperature reading can monitor different temperature sources (ex. CPUTIN, AUXTIN, PECL...etc).

	SMIOVT1	SMIOVT2
<b>Temperature source select</b>	Bank6,index21 bit[4:0] default: SYSTIN	Bank6, index22 bit[4:0] default:CPUTIN
<b>Temperature reading</b>	Bank0, index27	Bank1, index50 & index51 bit7

**PRELIMINARY**

Note. If the temperature source is selecting to PECI, please set Bank0 Index AEh first for reading correct value.

**8.6 PECI**

PECI (Platform Environment Control Interface) is a new digital interface to read the CPU temperature of Intel® CPUs. With a bandwidth ranging from 2 Kbps to 2 Mbps, PECI uses a single wire for self-clocking and data transfer. By interfacing to the Digital Thermal Sensor (DTS) in the Intel® CPU, PECI reports a negative temperature (in counts) relative to the processor’s temperature at which the thermal control circuit (TCC) is activated. At the TCC Activation temperature, the Intel CPU will operate at reduced performance to prevent the device from thermal damage.

PECI is one of the temperature sensing methods that the NCT5532D supports. The NCT5532D contains a PECI master and reads the CPU PECI temperature. The CPU is a PECI client.

The PECI temperature values returning from the CPU are in “counts” which are approximately linear in relation to changes in temperature in degrees centigrade. However, this linearity is approximate and cannot be guaranteed over the entire range of PECI temperatures. For further information, refer to the PECI specification. All references to “temperature” in this section are in “counts” instead of “°C”.

Figure 8-8 PECI Temperature shows a typical fan speed (PWM duty cycle) and PECI temperature relationship.

Figure 8-8 PECI Temperature

In this illustration, when PECI temperature is -20, the PWM duty cycle for fan control is at Duty2. When CPU is getting hotter and the PECI temperature is -10, the PWM duty cycle is at Duty1.

At Tcontrol PECI temperature, the recommendation from Intel is to operate the CPU fan at full speed. Therefore Duty1 is 100% if this recommendation is followed. The value of Tcontrol can be obtained by reading the related Machine Specific Register (MSR) in the Intel CPU. The Tcontrol MSR address is usually in the BIOS Writer’s guide for the CPU family in question. Refer to the relevant CPU documentation from Intel for more information. In this example, Tcontrol is -10.

When the PECI temperature is below -20, the duty cycle is fixed at Duty2 to maintain a minimum (and constant) RPM for the CPU fan.

**PRELIMINARY**

The device also provides an offset register to ‘shift’ the negative PECI readings to positive values. The offset registers are called “Tbase”, which are located at Bank7 Index 09h for Agent0 and Bank7 Index 0Ah for Agent1. All default values of these Tbase registers are 8’h00. The unit of the Tbase register contents is “count” to match that of PECI values. The resultant value (Tbase + PECI) should not be interpreted as the “temperature” (whether in count or °C) of the PECI client (CPU).

The Figure 8-9 Temperature and Fan Speed Relation after Tbase Offsets, shows the temperature and fan-speed relationship after Tbase offset is applied (based on Figure 8-8 PECI Temperature). This view is from the perspective of the NCT5532D fan control circuit.

Figure 8-9 Temperature and Fan Speed Relation after Tbase Offsets

Assuming Tbase is set to 100 and the PECI temperature is -15 , the real-time temperature value to the fan control circuit will be 85 (-15 + 100). The value of 55 (hex) will appear in the relevant real-time temperature register.

While using Smart Fan control function of NCT5532D, BIOS/software can include Tbase in determining the thresholds (limits). In this example, assuming Tcontrol is -10 and Tbase is set to 100 <sup>(1)</sup>, the threshold temperature value corresponding to the “100% fan duty-cycle” event is 90 (-10+100). The value of 5A (hex) should be written to the relevant threshold register.

Tcontrol is typically -10 to -20 for PECI-enabled CPUs. Base on that, a value of 85 ~100 for Tbase could be set for proper operation of the fan control circuit. This recommendation is applicable for most designs. In general, the concept presented in this section could be used to determine the optimum value of Tcontrol to match the specific application.

### 8.7 Fan Speed Measurement and Control

This section is divided into two parts, one to measure the speed and one to control the speed.

#### 8.7.1 Fan Speed Reading

The fan speed reading at:

	FAN COUNT READING		FAN RPM READING	
	13-bit		16-bit	
	[12:5]	[4:0]	[15:8]	[7:0]
<b>SYSFANIN</b>	Bank4, indexB0	Bank4, indexB1	Bank4, indexC0	Bank4, indexC1
<b>CPUFANIN</b>	Bank4, indexB2	Bank4, indexB3	Bank4, indexC2	Bank4, indexC3

#### 8.7.2 Fan Speed Calculation by Fan Count Reading

In 13-bit fan count reading, please read high byte first then low byte.

Fan speed RPM can be evaluated by the following equation.

$$RPM = \frac{1.35 \times 10^6}{Count}$$

#### 8.7.3 Fan Speed Calculation by Fan RPM Reading

In 16-bit fan RPM reading, please read high byte first then low byte.

Fan speed RPM can be evaluated by translating 16-bit RPM reading from hexadecimal to decimal.

Register reading 0x09C4h = 2500 RPM

#### 8.7.4 Fan Speed Control

The NCT5532D has 2 output pins for fan control, Only SYSFANOUT offers PWM duty cycle and DC voltage to control the fan speed. The output type (PWM or DC) of each pin is configured by Bank0 index 04h, bits 0 for SYSFANOUT.

	SYSFANOUT	CPUFANOUT
<b>Output Type Select</b>	Bank0, index04 bit0  0: PWM output 1: DC output (default)	<b>Only PWM output</b>
<b>Output Type Select (in PWM output)</b>	CR24 bit4  0: open-drain (default) 1: push-pull	CR24 bit3  0: open-drain (default) 1: push-pull
<b>PWM Output Frequency</b>	Bank0, Index00	Bank0, Index02
<b>Fan Control Mode Select</b>	Bank1, index02, bit[7:4]  0h: Manual mode (def.) 1h: Thermal Cruise	Bank2, index02, bit[7:4]  0h: Manual mode(def.) 1h: Thermal Cruise

**PRELIMINARY**

		2h: Speed Cruise 4h: SMART FAN IV	2h: Speed Cruise 4h: SMART FAN IV
<b>Output Value (write)</b>	<b>PWM output (Duty)</b>	Bank1, index09 bit[7:0]	Bank2, index09 bit[7:0]
	<b>DC output (Voltage)</b>	Bank1, index09 bit[7:2]	
<b>Current Output Value (read only)</b>		Bank0, index01	Bank0, index03

For PWM, the duty cycle is programmed by eight-bit registers at Bank1 Index 09h for SYSFANOUT, Bank2 Index 09h for CPUFANOUT. The duty cycle can be calculated using the following equation:

$$\text{Dutycycle(\%)} = \frac{\text{Programmed 8-bit Register Value}}{255} \times 100\%$$

The default duty cycle is 7Fh, or 50% for SYSFANOUT and CPUFANOUT.

Note. The default speed of fan output is specified in registers CR[E0h] and CR[E1h] of Logical Device B.

The PWM clock frequency is programmed at Bank0 Index 00h, Index 02h.

For DC, the NCT5532D has a six bit digital-to-analog converter (DAC) that produces 0 to 2.048 Volts DC. The analog output is programmed at Bank1 Index 09h bit [7:2] for SYSFANOUT. The analog output can be calculated using the following equation:

$$\text{OUTPUT Voltage (V)} = V_{ref} \times \frac{\text{Programmed 6-bit Register Value}}{64}$$

The default value is 111111YY, or nearly 2.048 V, and Y is a reserved bit.

**8.7.5 SMART FAN™ Control**

The NCT5532D supports various different fan control features:

- ◆ SMART FAN™ I (Thermal Cruise & Speed Cruise)
- ◆ SMART FAN™ IV
- ◆ SMART FAN™ IV Close-Loop Fan Control RPM mode

	<b>SYSFANOUT</b>	<b>CPUFANOUT</b>
<b>Fan Control Mode Select</b>	Bank1, index02, bit[7:4]  0h: Manual mode (def.) 1h: Thermal Cruise 2h: Speed Cruise 4h: SMART FAN IV	Bank2, index02, bit[7:4]  0h: Manual mode(def.) 1h: Thermal Cruise 2h: Speed Cruise 4h: SMART FAN IV

8.7.6 Temperature Source & Reading for Fan Control

Select temperature source for each fan control output:

	SYSFANOUT	CPUFANOUT
<b>Fan Control Temperature Source Select</b>	Bank1, index00 bit[4:0]  Default: SYSTIN	Bank2, index00 bit[4:0]  Default: CPUTIN
<b>Fan Control Temperature Reading</b>	Bank0, index73 & Bank0, index74 bit7	Bank0, index75 & Bank0, index76 bit7

Note. If the temperature source is selecting to PECl, please set Bank0 Index AEh first for reading correct value.

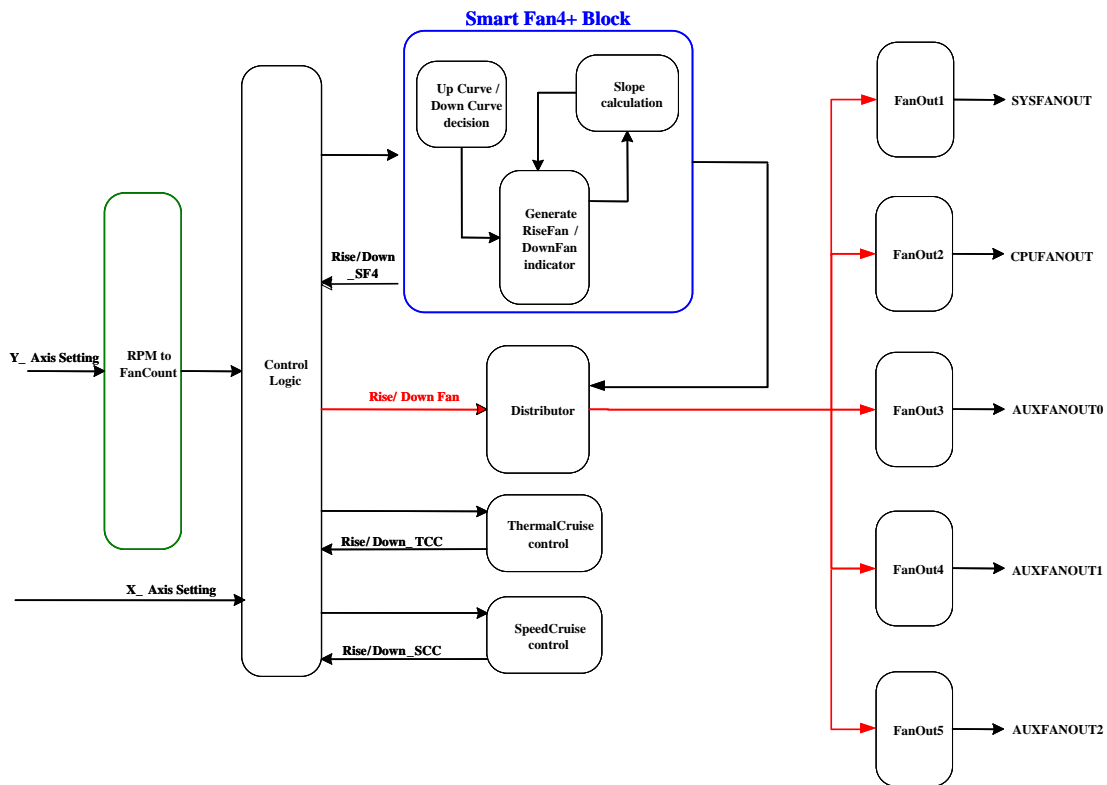

Figure 8-10 SMART FAN™ Function Block Diagram

8.8 SMART FAN™ I

8.8.1 Thermal Cruise Mode

Thermal Cruise mode controls the fan speed to keep the temperature in a specified range. First, this range is defined in BIOS by a temperature and the interval (e.g., 55 °C ± 3 °C). As long as the current temperature remains below the low end of this range (i.e., 52 °C), the fan is off. Once the temperature exceeds the low end, the fan turns on at a speed defined in BIOS (e.g., 20% output). Thermal Cruise mode then controls the fan output according to the current temperature. Three conditions may occur:

- (1) If the temperature still exceeds the high end, fan output increases slowly. If the fan is operating at full speed but the temperature still exceeds the high end, a warning message is issued to protect the system.
- (2) If the temperature falls below the high end (e.g., 58°C) but remains above the low end (e.g., 52 °C), fan output remains the same.

**PRELIMINARY**

(3) If the temperature falls below the low end (e.g., 52 °C), fan output decreases slowly to zero or to a specified “stop value”.

This “stop value” is enabled by the Bank1, Index00h, Bit7 for SYSFANOUT; Bank2, Index00h, Bit7 for CPUFANOUT.

The “stop value” itself is separately specified in Bank1 Index05h, Bank2 Index05h.

The “stop time” means fan remains at the stop value for the period of time also separately defined in Bank1 Index07h, Bank2 Index07h.

Note. The function only support for Thermal Cruise Mode.

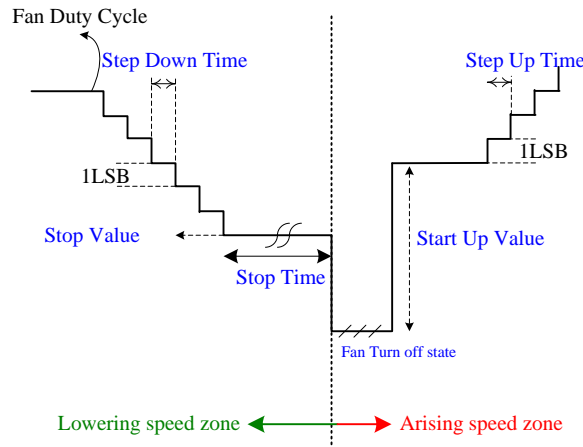

Figure 8-11 Thermal Cruise™ Mode Parameters Figure

In general, Thermal Cruise mode means

- If the current temperature is higher than the high end, increase the fan speed.
- If the current temperature is lower than the low end, decrease the fan speed.
- Otherwise, keep the fan speed the same.

The following figures illustrate two examples of Thermal Cruise mode.

Figure 8-12 Mechanism of Thermal Cruise™ Mode (PWN Duty Cycle)

PRELIMINARY

Figure 8-13 Mechanism of Thermal Cruise™ Mode (DC Output Voltage)

**8.8.2 Speed Cruise Mode**

Speed Cruise mode keeps the fan speed in a specified range. First, this range is defined in BIOS by a fan speed count (the amount of time between clock input signals, not the number of clock input signals in a period of time) and an interval (e.g.,  $160 \pm 10$ ). As long as the fan speed count is in the specified range, fan output remains the same. If the fan speed count is higher than the high end (e.g., 170), fan output increases to make the count lower. If the fan speed count is lower than the low end (e.g., 150), fan output decreases to make the count higher. One example is illustrated in this figure.

Figure 8-14 Mechanism of Fan Speed Cruise™ Mode

The following tables show current temperatures, fan output values and the relative control registers at Thermal Cruise and Fan Speed mode.

**PRELIMINARY**

Table 8-2 Relative Registers – at Thermal Cruise™ Mode

THERMAL CRUISE MODE	TARGET TEMPERATURE	TOLERANCE	START-UP VALUE	STOP VALUE	KEEP MIN. FAN OUTPUT VALUE	STOP TIME	STEP- UP TIME	STEP-DOWN TIME

CPUFANOUT	Bank 2, Index 01h	Bank 2, Index 0C bit[3:0]	Bank 2, Index 02 bit[2:0]	Bank 2, Index 0C bit[6:4]	Bank 2, Index 03h	Bank 2, Index 04h	Bank 2, Index 02h bit[7:4] = 02h

**8.9 SMART FAN™ IV & Close Loop Fan Control Mode**

SMART FAN™ IV and Close Loop Fan Control Mode offer 3 slopes to control the fan speed.

Set **Critical Temperature, Bank1 Index 35<sub>HEX</sub>, Bank2 Index 35<sub>HEX</sub>**.

- Set the **Relative Register-at SMART FAN™ IV Control Mode Table**  
If fan control mode is set as Close Loop Fan Control, the unit step is 50RPM. So the maximum controllable RPM is 50\*255=12,750RPM.
- Set Tolerance of **Target Temperature, Bank1 Index 02<sub>HEX</sub> bit [2:0], Bank2 Index 02<sub>HEX</sub> bit [2:0]**.

The 3 slopes can be obtained by setting FanDuty1/RPM1~FanDuty4/RPM4 and T1~T4 through the registers. When the temperature rises, FAN Output will calculate the target FanDuty/RPM based on the current slope. For example, assuming Tx is the current temperature and Ty is the target, then

The slope:

$$X2 = \frac{(FanDuty3 / RPM 3) - (FanDuty2 / RPM 2)}{(T3 - T2)}$$

**PRELIMINARY**

Figure 8-15 SMART FAN™ IV & Close Loop Fan Control Mechanism

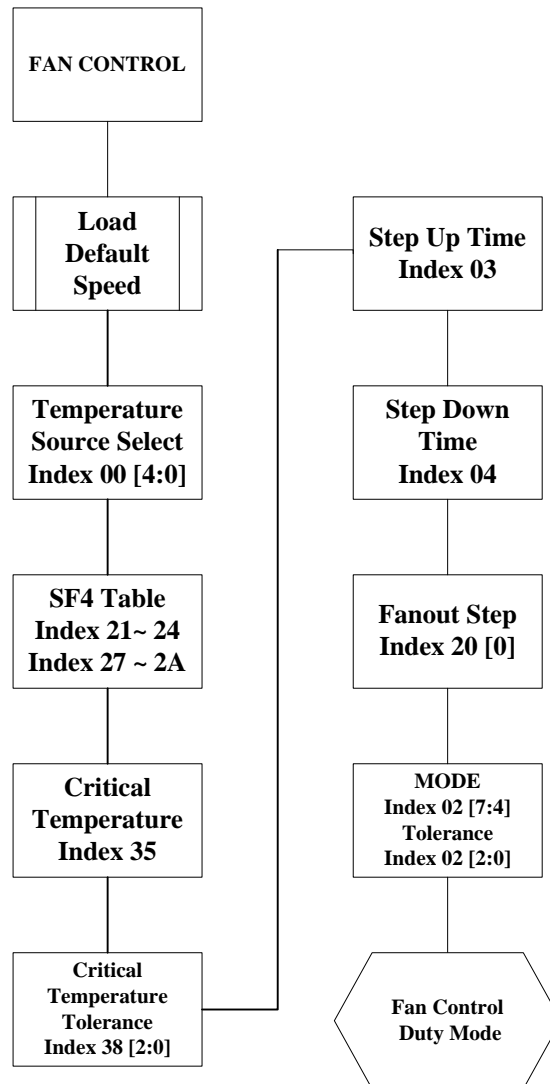

Figure 8-16 Fan Control Duty Mode Programming Flow

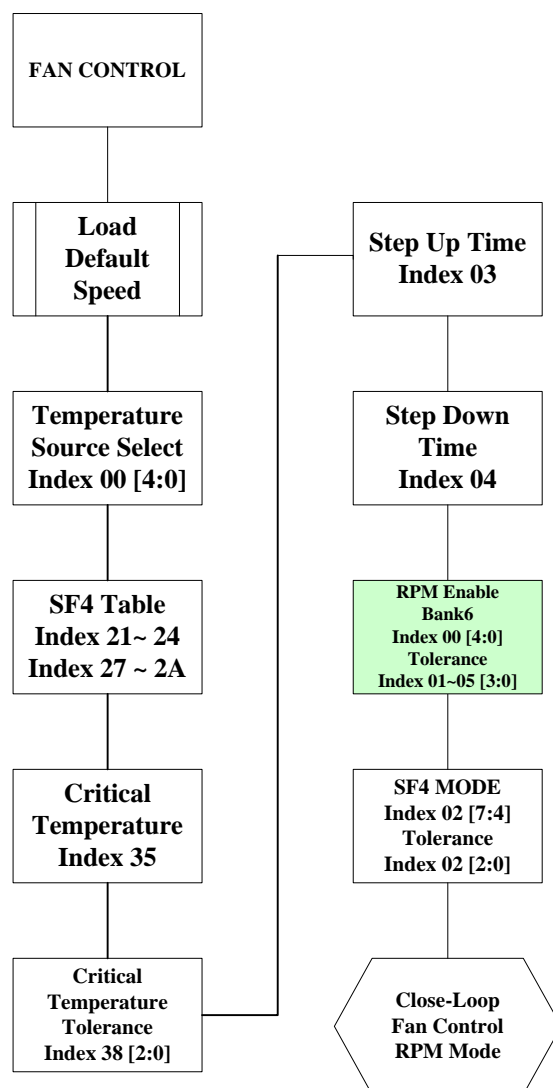

Figure 8-17 Close-Loop Fan Control RPM mode Programming Flow

### 8.9.1 Step Up Time / Step Down Time

SMART FAN™ IV is designed for the smooth operation of the fan. The Up Time / Down Time register defines the time interval between successive duty increases or decreases. If this value is set too small, the fan will not have enough time to speed up after tuning the duty and sometimes may result in unstable fan speed. On the other hand, if Up Time / Down Time is set too large, the fan may not work fast enough to dissipate the heat.

### 8.9.2 Fan Output Step

The “Fanout Step” itself is separately specified in Bank1 Index20h bit0 for SYSFANOUT, Bank2 Index20h bit0 for CPUFANOUT.

This example for Fanout Step exposition:

Figure 8-18 CPUFAN SMART FAN™ IV Table Parameters Figure

Figure 8-19 Fanout Step Relation of CPUFANOUT

**8.9.3 Revolution Pulse Selection**

The NCT5532D supports four RPM output of the pulses selection function for different type of FAN which has the character of different pulses per revolution. The others could be set by HM register at Bank6, Index44, Bit1-0 for SYSFANIN; Index45, Bit1-0 for CPUFANIN. All default value of pulse selection registers are 2 pulses of one revolution.

Setting description for “Pulse Selections Bits”:

- 00: 4 pulses per revolution
- 01: 1 pulse per revolution
- 10: 2 pulses per revolution (default)
- 11: 3 pulses per revolution

**8.9.4 Weight Value Control**

The NCT5532D supports weight value control for fan duty output. By register configuration, the results of weight value circuit can be added to the fan duty of SMART FAN™ I or IV and output to the fan. Take CPUFANOUT for example, if SMART FAN™ IV is selected, CPUFANOUT is the temperature source, and weight value control is enabled, SMART FAN™ IV will calculate the output duty, and weight value circuit will calculate the corresponding weight value based on SYSTIN. As the SYSTIN temperature rises, its corresponding weight value increases. Then, the two values will be summed up and output to CPU fan. In other words, the CPU fan duty is affected not only by the CPUFANOUT but also the SYSTIN temperature.

Figure 8-20 SYS TEMP and Weight Value Relations shows the relation between the SYSTIN temperature and the weight value. Tolerance setup is offered on each change point to avoid weight value fluctuation resulted from

**PRELIMINARY**

SYSTIN temperature change. The weight value will increase by one weight value step only when the SYSTIN temperature is higher than the point value plus tolerance. Likewise, the weight value decreases by one weight value step only when the SYSTIN temperature is lower than the point value minus tolerance.

Nots : This relative register should not be zero and not support negative temperature.

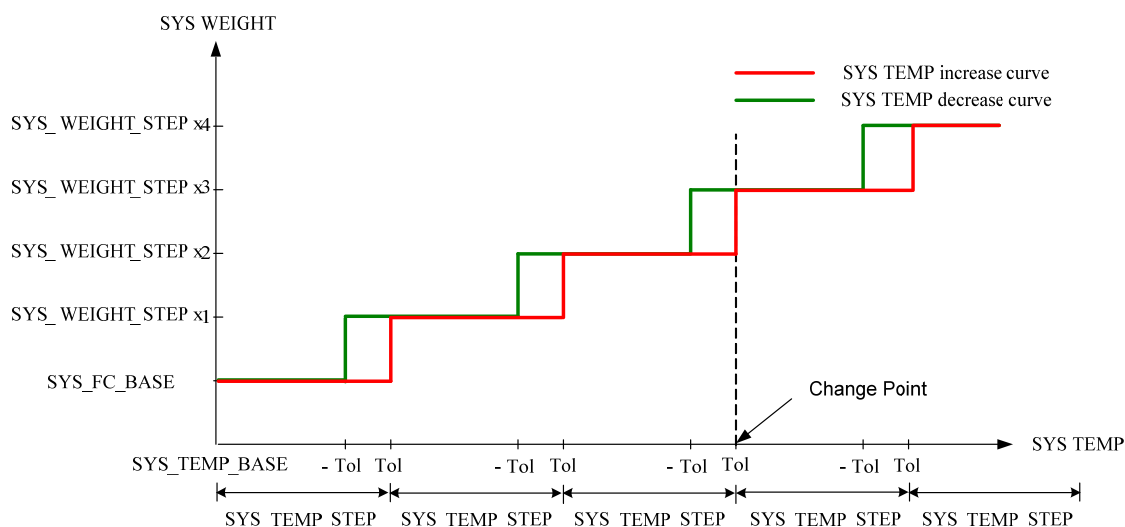

Figure 8-20 SYS TEMP and Weight Value Relations

### 8.10 Alert and Interrupt

NCT5532D supports 6 Temperature Sensors for interrupt detection depending on selective monitor temperature source.

	SMIOVT1	SMIOVT2
Temperature source select	Bank6, index21 bit[4:0]  default: SYSTIN	Bank6, index22 bit[4:0]  default: CPUTIN
Temperature reading (2's)	Bank0, index27	Bank1, index50 &

complement)		index51 bit7
Temperature High Limit	Bank0, index39	Bank1, index55 & index56 bit7
Temperature Low Limit	Bank0, index3A	Bank1, index53 & index54 bit7

SMIOVT Relative Temperature Registers

**8.10.1 SMI# Interrupt Mode**

The SMI#/OVT# pin is a multi-function pin. It can be in HM\_SMI# mode or in OVT# mode by setting Configuration Register CR24h, bit 2. In HM\_SMI# mode, it can monitor voltages, fan counts, or temperatures.

**8.10.2 Voltage SMI# Mode**

The SMI# pin can create an interrupt if a voltage exceeds a specified high limit or falls below a specified low limit. This interrupt must be reset by reading all the interrupt status registers, or subsequent events do not generate interrupts. This mode is illustrated in the following figure.

\*Interrupt Reset when Interrupt Status Registers are read

Figure 8-22 SMI Mode of Voltage and Fan Inputs

**8.10.3 Fan SMI# Mode**

The SMI# pin can create an interrupt if a fan count crosses a specified fan limit (rises above it or falls below it). This interrupt must be reset by reading all the interrupt status registers, or subsequent events do not generate interrupts. This mode is illustrated in the figure above.

**8.10.4 Temperature SMI# Mode**

The SMI# pin can create interrupts that depend on the temperatures measured by CPUTIN, and AUXTIN.

**8.10.4.1. Temperature Sensor 1 SMI# Interrupt (Default: SYSTIN)**

The SMI# pin has four interrupt modes with Temperature Sensor 1.

**(1) Shut-down Interrupt Mode**

This mode is enabled by setting Bank0 Index 40h, bit 4 to one.

PRELIMINARY

In this mode, the SMI# pin can create an interrupt when the current temperature rises above  $T_{OL}$  or Shut-down mode high limit temperature, and when the current temperature falls below  $T_{HYST}$  or Shut-down mode low limit temperature. Once the temperature rises above  $T_{OL}$ , however, and generates an interrupt, this mode does not generate additional interrupts, even if the temperature remains above  $T_{OL}$ , until the temperature falls below  $T_{HYST}$ . This interrupt must be reset by reading all the interrupt status registers, or subsequent events do not generate interrupts, except the first time current temperature rises above Shut-down mode high limit temperature. This is illustrated in the following figure.

Figure 8-23 Shut-down Interrupt Mode

(2) Comparator Interrupt Mode

This mode is enabled by setting  $T_{HYST}$  (Temperature Hysteresis) to 127°C. This mode is enabled by setting Bank0 Index 40h, bit 4 to 0.

In this mode, the SMI# pin can create an interrupt as long as the current temperature exceeds  $T_O$  (Over Temperature). This interrupt can be reset by reading all the interrupt status registers, or subsequent events do not generate interrupts. If the interrupt is reset, the SMI# pin continues to create interrupts until the temperature goes below  $T_O$ . This is illustrated in the figure below.

Comparator Interrupt Mode

Two-Times Interrupt Mode

Figure 8-24 SMI Mode

**(3) Two-Times Interrupt Mode**

This mode is enabled by setting  $T_{HYST}$  (Temperature Hysteresis) lower than  $T_O$  and setting Bank0 Index 4Ch, bit 5 to zero. This mode is enabled by setting Bank0 Index 40h, bit 4 to 0.

In this mode, the SMI# pin can create an interrupt when the current temperature rises above  $T_O$  or when the current temperature falls below  $T_{HYST}$ . Once the temperature rises above  $T_O$ , however, and generates an interrupt, this mode does not generate additional interrupts, even if the temperature remains above  $T_O$ , until the temperature falls below  $T_{HYST}$ . This interrupt must be reset by reading all the interrupt status registers, or subsequent events do not generate interrupts. This is illustrated in the figure above.

Figure 3- **One-Time Interrupt Mode**

This mode is enabled by setting  $T_{HYST}$  (Temperature Hysteresis) lower than  $T_O$  and setting Bank0 Index 4Ch, bit 5 to one. This mode is enabled by setting Bank0 Index 40h, bit 4 to 0.

In this mode, the SMI# pin can create an interrupt when the current temperature rises above  $T_O$ . Once the temperature rises above  $T_O$ , however, and generates an interrupt, this mode does not generate additional interrupts, even if the temperature remains above  $T_O$ , until the temperature falls below  $T_{HYST}$ . This interrupt must be reset by reading all the interrupt status registers, or subsequent events do not generate interrupts. This is illustrated in the following figure.

\*Interrupt Reset when Interrupt Status Registers are read

One-Time Interrupt Mode

Figure 8-25 SMI Mode of SYSTIN II

**8.10.4.2. SMI# Interrupt of Temperature Sensor 2 (Default: CPUTIN) and Temperature Sensor 3 (Default: AUXTIN) and Temperature Sensor 4 (Default: SYSTIN) and Temperature Sensor 5 (Default: SYSTIN) and Temperature Sensor 6 (Default: SYSTIN).**

The SMI# pin has 3 interrupt modes with Temperature Sensor 2~6.

**(1) Shut-down Interrupt Mode**

This mode is enabled by Bank0 Index 40h, bit5 to one for Temperature Sensor 2; Bank0 Index 40h, bit6 to one for Temperature Sensor 3; Bank6 Index 74h, bit1 to one for Temperature Sensor 4; Bank6 Index 79h, bit1 to one for Temperature Sensor 5 and Bank6 Index 7Eh, bit1 to one for Temperature Sensor 6.

In this mode, the SMI# pin can create an interrupt when the current temperature rises above  $T_{OL}$  or Shut-down mode high limit temperature, and when the current temperature falls below  $T_{HYST}$  or Shut-down mode low limit temperature. Once the temperature rises above  $T_{OL}$ , however, and generates an interrupt, this mode does not generate additional interrupts, even if the temperature remains above  $T_{OL}$ , until the temperature falls below  $T_{HYST}$ . This interrupt must be reset by reading all the interrupt status registers, or subsequent events do

**PRELIMINARY**

not generate interrupts, except the first time current temperature rises above Shut-down mode high limit temperature. This is illustrated in the following figure.

Figure 8-26 Shut-down Interrupt Mode

**(2) Comparator Interrupt Mode**

This mode is enabled by setting Bank0 Index 4Ch, bit 6, to one.

In this mode, the SMI# pin can create an interrupt when the current temperature exceeds  $T_O$  (Over Temperature) and continues to create interrupts until the temperature falls below  $T_{HYST}$ . This interrupt can be reset by reading all the interrupt status registers, or subsequent events do not generate interrupts. This is illustrated in the figure below.

\*Interrupt Reset when Interrupt Status Registers are read

Figure 8-27 SMI Mode of CPUTIN

**(3) Two-Times Interrupt Mode**

This mode is enabled by setting Bank0 Index 4Ch, bit 6, to zero.

In this mode, the SMI# pin can create an interrupt when the current temperature rises above  $T_O$  or when the current temperature falls below  $T_{HYST}$ . Once the temperature rises above  $T_O$ , however, and generates an

**PRELIMINARY**

interrupt, this mode does not generate additional interrupts, even if the temperature remains above  $T_o$ , until the temperature falls below  $T_{HYST}$ . This interrupt must be reset by reading all the interrupt status registers, or subsequent events do not generate interrupts. This is illustrated in the figure above.

**8.10.5 OVT# Interrupt Mode**

**PRELIMINARY**

The SMI#/OVT# pin is a multi-function pin. It can be in SMI# mode or in OVT# mode by setting Configuration Register CR[24h], bit 2 to one or zero, respectively. In OVT# mode, it can monitor temperatures, and OVT pin could be enabled to OVT output by Bank0 Index 18h, bit 6 for Temperature Sensor 1(default: SYSTIN); Bank1 Index 52h, bit 1 for Temperature Sensor 2(default: CPUTIN); Bank2 Index 52h, bit1 for Temperature Sensor 3(default: AUX TIN); Bank6 Index 28h, bit1 for Temperature Sensor 4(default: SYSTIN); Bank6 Index 29h, bit1 for Temperature Sensor 5(default: SYSTIN)and Bank6 Index 2Ah, bit1 for Temperature Sensor 6(default: SYSTIN).

The OVT# pin has two interrupt modes, comparator and interrupt. The modes are illustrated in this figure.

Figure 8-28 OVT# Modes of Temperature Inputs

If Bank0 Index 18h, bit 4, is set to zero, the OVT# pin is in comparator mode. In comparator mode, the OVT# pin can create an interrupt once the current temperature exceeds  $T_O$  and continues to create interrupts until the temperature falls below  $T_{HYST}$ . The OVT# pin is asserted once the temperature has exceeded  $T_O$  and has not yet fallen below  $T_{HYST}$ .

If Bank0 Index 18h, bit 4, is set to one, the OVT# pin is in interrupt mode. In interrupt mode, the OVT# pin can create an interrupt once the current temperature rises above  $T_O$  or when the temperature falls below  $T_{HYST}$ . Once the temperature rises above  $T_O$ , however, and generates an interrupt, this mode does not generate additional interrupts, even if the temperature remains above  $T_O$ , until the temperature falls below  $T_{HYST}$ . This interrupt must be reset by reading all the interrupt status registers. The OVT# pin is asserted when an interrupt is generated and remains asserted until the interrupt is reset.

### 9. HARDWARE MONITOR REGISTER SET

The base address of the Address Port and Data Port is specified in registers CR[60h] and CR[61h] of Logical Device B, the hardware monitor device. CR[60h] is the high byte, and CR[61h] is the low byte. The Address Port and Data Port are located at the base address, plus 5h and 6h, respectively. For example, if CR[60h] is 02h and CR[61h] is 90h, the Address Port is at 0x295h, and the Data Port is at 0x296h.

Remember that this access is from the host CPU I/O address range. To conserve space in the crowded CPU I/O addresses, many of the hardware monitor registers are “banked” with the bank number located at Bank0, index 04Eh.

#### 9.1 Address Port (Port x5h)

Attribute: Bit 6:0 Read/Write , Bit 7: Reserved

Size: 8 bits

BIT	7	6	5	4	3	2	1	0

#### 9.2 Data Port (Port x6h)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	DATA							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7-0	Data to be read from or to be written to Value RAM and Register.

**PRELIMINARY**

**9.3 SYSFANOUT PWM Output Frequency Configuration Register – Index 00h (Bank 0)**

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	PWM_CLK_SEL1	PWM_SCALE1						
DEFAULT	0	0	0	0	0	1	0	0

The register is meaningful only when SYSFANOUT is programmed for PWM output (i.e., Bank0, Index 04h, bit 0 is 0).

BIT	DESCRIPTION
7	<b>PWM_CLK_SEL1. SYSFANOUT PWM Input Clock Source Select.</b> This bit selects the clock source for PWM output frequency. Refer the Divisor table.
6-0	<b>PWM_SCALE1. SYSFANOUT PWM Pre-Scale divider.</b> The clock source for PWM output is divided by this seven-bit value to calculate the actual PWM output frequency. Refer the Divisor table.

The clock source selected by CKSEL will be divided by the divisor and used as a fan PWM output frequency.

If CKSEL equals **0**, then the output clock is simply equal to **93.9/ (Divisor[6:0]+1) KHz**

MappedDivisor depends on **Divisor[6:0]** and is described in the table below.

Divisor[6:0]	Mapped Divisor	Output Frequency	Divisor[6:0]	Mapped Divisor	Output Frequency
0000000	1	93.9KHz	.....		
0000001	2	46.95KHz			
0000010	3	31.3KHz			
0000011	4	23.47KHz			
0000100	5	18.78KHz	0001111	16	5.86KHz
0000101	6	15.65KHz	0011111	32	2.93KHz
0000110	7	13.41KHz	0111111	64	1.46KHz
0000111	8	11.73KHz	1111111	128	734Hz

If CKSEL equals **1**, then the output clock is simply equal to **1008/ Mapped Divisor Hz**

MappedDivisor depends on **Divisor[3:0]** and is described in the table below.

Divisor[3:0]	Mapped Divisor	Output Frequency	Divisor[3:0]	Mapped Divisor	Output Frequency
0000	1	1008Hz	1000	12	84Hz
0001	2	504Hz	1001	16	63Hz
0010	3	336Hz	1010	32	31.5Hz
0011	4	252Hz	1011	64	15.75Hz
0100	5	201Hz	1100	128	7.875Hz
0101	6	168Hz	1101	256	3.94Hz
0110	7	144Hz	1110	512	1.97Hz
0111	8	126Hz	1111	1024	0.98Hz

**9.4 SYSFANOUT Output Value Select Register – Index 01h (Bank 0)**

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	SYSFAN MODE				Reserved	Tolerance of SYSFAN Target Temperature or SYSFANIN Target Speed_L		
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
-----	-------------

**PRELIMINARY**

7-4	<b>SYSFANOUT Mode Select.</b> 0000: SYSFANOUT is in Manual Mode. <b>(Default)</b> 0001: SYSFANOUT is in Thermal Cruise Mode. 0010: SYSFANOUT is in Speed Cruise Mode. 0100: SYSFANOUT is in SMART FAN IV Mode.
3	<b>Reserved</b>
2-0	Tolerance of SYSFAN Target Temperature or SYSFANIN Target Speed_L.

**9.60 SYSFANOUT Step Up Time Register – Index 03h (Bank 1)**

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	SYSFANOUT Value Step Up Time							
DEFAULT	0	0	0	0	1	0	1	0

In SMART FAN™ mode, this register determines the amount of time SYSFANOUT takes to increase its value by one step.

(1) For PWM output:

The units are intervals of 0.1 second. The default time is 1 second.

(2) For DC output:

The units are intervals of 0.4 second. The default time is 4 seconds.

**9.61 SYSFANOUT Step Down Time Register – Index 04h (Bank 1)**

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	SYSFANOUT Value Step Down Time							
DEFAULT	0	0	0	0	1	0	1	0

In SMART FAN™ mode, this register determines the amount of time SYSFANOUT takes to decrease its value by one step.

(1) For PWM output:

The units are intervals of 0.1 second. The default time is 1 second.

(2) For DC output:

The units are intervals of 0.4 second. The default time is 4 seconds.

**9.62 SYSFANOUT Stop Value Register – Index 05h (Bank 1)**

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	SYSFANOUT Stop Value							
DEFAULT	0	0	0	0	0	0	0	1

In Thermal Cruise mode, the SYSFANOUT value decreases to this eight-bit value if the temperature stays below the lowest temperature limit. This value should not be zero.

Please note that Stop Value does not mean that the fan really stops. It means that if the temperature keeps below low temperature limit, then the fan speed keeps on decreasing until reaching a minimum value, and this is Stop Value.

### 9.63 SYSFANOUT Start-up Value Register – Index 06h (Bank 1)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	SYSFANOUT Start-Up Value							
DEFAULT	0	0	0	0	0	0	0	1

In Thermal Cruise mode, SYSFANOUT value increases from zero to this eight-bit register value to provide a minimum value to turn on the fan. This value should not be zero.

### 9.64 SYSFANOUT Stop Time Register – Index 07h (Bank 1)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	SYSFANOUT Value Stop Time							
DEFAULT	0	0	1	1	1	1	0	0

In Thermal Cruise mode, this register determines the amount of time it takes SYSFANOUT value to fall from the stop value to zero.

(1) For PWM output:

The units are intervals of 0.1 second. The default time is 1 second.

(2) For DC output:

The units are intervals of 0.4 second. The default time is 4 seconds.

### 9.65 Reserved Register – Index 08h (Bank 1)

### 9.66 SYSFANOUT Output Value Select Register – Index 09h (Bank 1)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	SYSFANOUT Value							
DEFAULT	0	1	1	1	1	1	1	1

The default speed of fan output is specified in registers CR[E0h] to CR[E4h] of Logical Device B, CR[E0h] is the Default Speed Configuration Register of SYSFANOUT.

**PRELIMINARY**

FUNCTION MODE		7	6	5	4	3	2	1	0	
PWM Output (Bank0, Index 04h, bit 0 is 0)	<b>DESCRIPTION</b>	The PWM duty cycle is equal to this eight-bit value, divided by 255, times 100%. FFh creates a duty cycle of 100%, and 00h creates a duty cycle of 0%.								
DC Voltage Output Bank0, Index 04h, bit 0 is 1)	<b>DESCRIPTION</b>	SYSFANOUT voltage control. The output voltage is calculated according to this equation. <b>OUTPUT Voltage = <math>V_{ref} * \frac{FANOUT}{64}</math></b> Note. VREF is approx 2.048V.						Reserved

NAME	CPUTIN Target Temperature / CPUFANIN Target Speed_L							
DEFAULT	0	0	0	0	0	0	0	0

FUNCTION MODE		7	6	5	4	3	2	1	0
Thermal Cruise™	DESCRIPTION	CPUFAN Target Temperature							
Fan Speed Cruise™	DESCRIPTION	CPUFANIN Target Speed [7:0], [11:8] associate index 0C [3:0]							

**PRELIMINARY**

**9.107 CPUFAN MODE Register / CPUFAN TOLERRANCE Register – Index 02h (Bank 2)**

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	CPUFAN MODE				Reserved	Tolerance of CPUFAN Target Temperature or CPUFANIN Target Speed_L		
DEFAULT	0	0	0	0	0	0	1	0

BIT	DESCRIPTION
7-4	<b>CPUFANOUT Mode Select.</b> 0000: CPUFANOUT is in Manual Mode. (Default) 0001: CPUFANOUT is in Thermal Cruise Mode. 0010: CPUFANOUT is in Speed Cruise Mode. 0100: CPUFANOUT is in SMART FAN IV Mode.
3	<b>Reserved</b>
2-0	Tolerance of CPUFAN Target Temperature or CPUFANIN Target Speed_L.

**9.108 CPUFANOUT Step Up Time Register – Index 03h (Bank 2)**

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	CPUFANOUT Value Step Up Time							
DEFAULT	0	0	0	0	1	0	1	0

In SMART FAN™ mode, this register determines the amount of time CPUFANOUT takes to increase its value by one step.

(1) For PWM output:

The units are intervals of 0.1 second. The default time is 1 second.

**9.109 CPUFANOUT Step Down Time Register – Index 04h (Bank 2)**

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	CPUFANOUT Value Step Down Time							
DEFAULT	0	0	0	0	1	0	1	0

In SMART FAN™ mode, this register determines the amount of time CPUFANOUT takes to decrease its value by one step.

(1) For PWM output:

The units are intervals of 0.1 second. The default time is 1 second.

**9.110 CPUFANOUT Stop Value Register – Index 05h (Bank 2)**

Attribute: Read/Write

Size: 8 bits

<b>BIT</b>	7	6	5	4	3	2	1	0
<b>NAME</b>	CPUFANOUT Stop Value							
<b>DEFAULT</b>	0	0	0	0	0	0	0	1

In Thermal Cruise mode, the CPUFANOUT value decreases to this eight-bit value if the temperature stays below the lowest temperature limit. This value should not be zero.

Please note that Stop Value does not mean that the fan really stops. It means that if the temperature keeps below low temperature limit, then the fan speed keeps on decreasing until reaching a minimum value, and this is Stop Value.

**9.111 CPUFANOUT Start-up Value Register – Index 06h (Bank 2)**

Attribute: Read/Write

Size: 8 bits

<b>BIT</b>	7	6	5	4	3	2	1	0
<b>NAME</b>	CPUFANOUT Start-Up Value							
<b>DEFAULT</b>	0	0	0	0	0	0	0	1

In Thermal Cruise mode, CPUFANOUT value increases from zero to this eight-bit register value to provide a minimum value to turn on the fan. This value should not be zero.

**9.112 CPUFANOUT Stop Time Register – Index 07h (Bank 2)**

Attribute: Read/Write

Size: 8 bits

<b>BIT</b>	7	6	5	4	3	2	1	0
<b>NAME</b>	CPUFANOUT Value Stop Time							
<b>DEFAULT</b>	0	0	1	1	1	1	0	0

In Thermal Cruise mode, this register determines the amount of time it takes CPUFANOUT value to fall from the stop value to zero.

(1) For PWM output:

The units are intervals of 0.1 second. The default time is 1 second.

**9.113 Reserved Register – Index 08h (Bank 2)**

**9.114 CPUFANOUT Output Value Select Register – Index 09h (Bank 2)**

Attribute: Read/Write

Size: 8 bits

<b>BIT</b>	7	6	5	4	3	2	1	0
<b>NAME</b>	CPUFANOUT Value							

**PRELIMINARY**

<b>DEFAULT</b>	0	1	1	1	1	1	1	1
----------------	---	---	---	---	---	---	---	---

The default speed of fan output is specified in registers CR[E0h] to CR[E4h] of Logical Device B, CR[E1h] is the Default Speed Configuration Register of CPUFANOUT.

<b>FUNCTION MODE</b>		7	6	5	4	3	2	1	0
PWM Output Only	<b>DESCRIPTION</b>	The PWM duty cycle is equal to this eight-bit value, divided by 255, times 100%. FFh creates a duty cycle of 100%, and 00h creates a duty cycle of 0%.

BIT	DESCRIPTION
7~0	The data would be sent to client. <b>Default value is 00<sub>HEX</sub></b> .

**9.323 PECE Agent Relative Temperature Register (ARTR) – Index 17h-1Eh (Bank 7)**

These registers return the “raw data” retrieved from PECE GetTemp() command. These data could be the error codes (range: 8000H~81FFH) or relative temperatures to process the defined Tbase. The error code will only be update in **ARTR**; while “Temperature Reading Register”, Bank7 Index 20h and 21h, will not be updated when the error code is received. If the **RtHigher** mechanism is activated, the normal temperature will always be returned first. In case both 2 domains return errors, the return priority will be Overflow Error > Underflow Error > Missing Diode > General Error. The reset value is 8001<sub>HEX</sub>, in that PECE is defaulted to be off. In PECE, 8001<sub>HEX</sub> means the diode is missing.

Attribute: Read / Write(When Virtual\_En enable)

ADDRESS 17-1E	DESCRIPTION
17h[15:8],18h[7:0]	Domain0 Relative Temperature Agent0 [15:0]
19h[15:8],1Ah[7:0]	Domain1 Relative Temperature Agent0 [15:0]
1Bh[15:8],1Ch[7:0]	Domain0 Relative Temperature Agent1 [15:0]
1Dh[15:8],1Eh[7:0]	Domain1 Relative Temperature Agent1 [15:0]

GetTemp() PECE Temperature format:

BIT	DESCRIPTION
15	Sign Bit. ( <b>Sign</b> ) In PECE Protocol, this bit should always be 1 to represent a negative temperature.
14-6	The integer part of the relative temperature. ( <b>Temperature[8:0]</b> )
5	<b>TEMP_2</b> . 0.5°C unit.
4	<b>TEMP_4</b> . 0.25°C unit.
3	<b>TEMP_8</b> . 0.125°C unit.
2	<b>TEMP_16</b> . 0.0625°C unit.
1	<b>TEMP_32</b> . 0.03125°C unit.
0	<b>TEMP_64</b> . 0.015625°C unit.

GetTemp() Response Definition:

RESPONSE	MEANING
General Sensor Error (GSE)	Thermal scan did not complete in time. Retry is appropriate.
0x0000	Processor is running at its maximum temperature or is currently being reset.
All other data	Valid temperature reading, reported as a negative offset from the TCC activation temperature. The valide temperature reading is referred to <u>GetTemp() PECL Temperature format</u>

Error Code	Description	Host operation
8000 <sub>HEX</sub>	General Sensor Error	No further processing.
8001 <sub>HEX</sub>	Sensing Device Missing	
8002 <sub>HEX</sub>	Operational, but the temperature is lower than the sensor operation range.	Compulsorily write 0°C back to the temperature readouts.
8003 <sub>HEX</sub>	Operational, but the temperature is higher than the sensor operation range.	Compulsorily write 127°C back to the temperature readouts.
8004 <sub>HEX</sub> 81FF <sub>HEX</sub>	Reserved.	No further operation.

9.324 PECL Command Read Date Registers – Index 1F ~ 32h (Bank 7)

## 10. UART PORT

### 10.1 UART Control Register (UCR) (Read/Write)

The UART Control Register defines and controls the protocol for asynchronous data communications, including data length, stop bit, parity, and baud rate selection.

BIT	7	6	5	4	3	2	1	0
NAME	BDLAB	SSE	PBFE	EPE	PBE	MSBE	DLS1	DLS0
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	<b>BDLAB (Baud Rate Divisor Latch Access Bit).</b> When this bit is set to logic 1, designers can access the divisor (in 16-bit binary format) from the divisor latches of the baud-rate generator during a read or write operation. When this bit is set to logic 0, the Receiver Buffer Register, the Transmitter Buffer Register, and the Interrupt Control Register can be accessed.
6	<b>SSE (Set Silence Enable).</b> A logic 1 forces the Serial Output (SOUT) to a silent state (a logical 0). Only IRTX is affected by this bit; the transmitter is not affected.
5	<b>PBFE (Parity Bit Fixed Enable).</b> When PBE and PBFE of UCR are both set to logic 1, (1) if EPE is logic 1, the parity bit is logical 0 when transmitting and checking; (2) if EPE is logic 0, the parity bit is logical 1 when transmitting and checking.
4	<b>EPE (Even Parity Enable).</b> When PBE is set to logic 1, this bit counts the number of logic 1's in the data word bits and determines the parity bit. When this bit is set to logic 1, the parity bit is set to logic 1 if an even number of logic 1's are sent or checked. When the bit is set to logic 0, the parity bit is logic 1, if an odd number of logic 1's are sent or checked.
3	<b>PBE (Parity Bit Enable).</b> When this bit is set to logic 1, the transmitter inserts a stop bit between the last data bit and the stop bit of the SOUT, and the receiver checks the parity bit in the same position.
2	<b>MSBE (Multiple Stop Bit Enable).</b> Defines the number of stop bits in each serial character that is transmitted or received. (1) If MSBE is set to logic 0, one stop bit is sent and checked. (2) If MSBE is set to logic 1 and the data length is 5 bits, one-and-a-half stop bits are sent and checked. (3) If MSBE is set to logic 1 and the data length is 6, 7, or 8 bits, two stop bits are sent and checked.
1	<b>DLS1 (Data Length Select Bit 1).</b> Defines the number of data bits that are sent or checked in each serial character.
0	<b>DLS0 (Data Length Select Bit 0).</b> Defines the number of data bits that are sent or checked in each serial character.

DLS1	DLS0	DATA LENGTH
0	0	5 bits
0	1	6 bits
1	0	7 bits

**PRELIMINARY**

DLS1	DLS0	DATA LENGTH
1	1	8 bits

The following table identifies the remaining UART registers. Each one is described separately in the following sections.

Table 10-1 Register Summary for UART

		Bit Number								
Register Address Base			0	1	2	3	4	5	6	7
+ 0 BDLAB = 0	Receiver Buffer Register (Read Only)	RBR	RX Data Bit 0	RX Data Bit 1	RX Data Bit 2	RX Data Bit 3	RX Data Bit 4	RX Data Bit 5	RX Data Bit 6	RX Data Bit 7

\*: Bit 0 is the least significant bit. The least significant bit is the first bit serially transmitted or received.

\*\* : These bits are always 0 in 16450 Mode.

### 10.2 UART Status Register (USR) (Read/Write)

This 8-bit register provides information about the status of data transfer during communication.

BIT	7	6	5	4	3	2	1	0
NAME	RF EI	TSRE	TBRE	SBD	NSER	PBER	OER	RDR
DEFAULT	0	1	1	0	0	0	0	0

BIT	DESCRIPTION
7	<b>RF EI (RX FIFO Error Indication).</b> In 16450 mode, this bit is always set to logical 0. In 16550 mode, this bit is set to logical 1 when there is at least one parity-bit error and no stop0bit error or silent-byte detected in the FIFO. In 16550 mode, this bit is cleared to logical 0 by reading from the USR if there are no remaining errors left in the FIFO.
6	<b>TSRE (Transmitter Shift Register Empty).</b> In 16450 mode, this bit is set to logical 1 when TBR and TSR are both empty. In 16550 mode, it is set to logical 1 when the transmit FIFO and TSR are both empty. Otherwise, this bit is set to logical 0.
5	<b>TBRE (Transmitter Buffer Register Empty).</b> In 16450 mode, when a data character is transferred from TBR to TSR, this bit is set to logical 1. If ETREI of ICR is high, and interrupt is generated to notify the CPU to write next data. In 16550 mode, this bit is set to logical 1 when the transmit FIFO is empty. It is set to logical 0 when the CPU writes data into TBR or the FIFO.
4	<b>SBD (Silent Byte Detected).</b> This bit is set to logical 1 to indicate that received data are kept in silent state for the time it takes to receive a full word, which includes the start bit, data bits, parity bit, and stop bits. In 16550 mode, it indicates the same condition for the data on the top of the FIFO. When the CPU reads USR, it sets this bit to logical 0.
3	<b>NSER (No Stop Bit Error).</b> This bit is set to logical 1 to indicate that the received data have no stop bit. In 16550 mode, it indicates the same condition for the data on the top of the FIFO. When the CPU reads USR, it sets this bit to logical 0.
2	<b>PBER (Parity Bit Error).</b> This bit is set to logical 1 to indicate that the received data has the wrong parity bit. In 16550 mode, it indicates the same condition for the data on the top of the FIFO. When the CPU reads USR, it sets this bit to logical 0.
1	<b>OER (Overrun Error).</b> This bit is set to logical 1 to indicate that the received data have been overwritten by the next received data before they were read by the CPU. In 16550 mode, it indicates the same condition, instead of FIFO full. When the CPU reads USR, it sets this bit to logical 0.
0	<b>RDR (RBR Data Ready).</b> This bit is set to logical 1 to indicate that the received data are ready to be read by the CPU in the RBR or FIFO. When no data are left in the RBR or FIFO, the bit is set to logical 0.

### 10.3 Handshake Control Register (HCR) (Read/Write)

This register controls pins used with handshaking peripherals such as modems and also controls the diagnostic mode of the UART.

BIT	7	6	5	4	3	2	1	0
NAME	RESERVED			INTERNAL LOOPBACK ENABLE	IRQ ENABLE	LOOPBACK RI INPUT	RTS	DTR
DEFAULT	0	0	0	0	0	0	0	0

PRELIMINARY

BIT	DESCRIPTION
7-5	<b>Reserved.</b>
4	<b>Internal Loopback Enable.</b> When this bit is set to logic 1, the UART enters diagnostic mode, as follows: (1) SOUT is forced to logic 1, and SIN is isolated from the communication link. (2) The modem output pins are set to their inactive state. (3) The modem input pins are isolated from the communication link and connect internally as DTR (bit 0 of HCR) →DSR#, RTS ( bit 1 of HCR) →CTS#, Loopback RI input ( bit 2 of HCR) → RI# and IRQ enable ( bit 3 of HCR) →DCD#. Aside from the above connections, the UART operates normally. This method allows the CPU to test the UART in a convenient way.
3	<b>IRQ Enable.</b> The UART interrupt output is enabled by setting this bit to logic 1. In diagnostic mode, this bit is internally connected to the modem control input DCD#.
2	<b>Loopback RI Input.</b> This bit is only used in the diagnostic mode. In diagnostic mode, this bit is internally connected to the modem control input RI#.
1	<b>RTS (Request to Send).</b> This bit controls the RTS# output. The value of this bit is inverted and output to RTS#.
0	<b>DTR (Data Terminal Ready).</b> This bit controls the DTR# output. The value of this bit is inverted and output to DTR#.

10.4 Handshake Status Register (HSR) (Read/Write)

This register reflects the current state of four input pins used with handshake peripherals such as modems and records changes on these pins.

BIT	7	6	5	4	3	2	1	0
<b>NAME</b>	DCD	RI	DSR	CTS	TDCD	FERI	TDSR	TCTS
<b>DEFAULT</b>	NA	NA	NA	NA	NA	NA	NA	NA

BIT	DESCRIPTION
7	<b>DCD (Data Carrier Detect).</b> This bit is the inverse of the DCD# input and is equivalent to bit 3 of HCR in Loopback mode.
6	<b>RI (Ring Indicator).</b> This bit is the inverse of the RI# input and is equivalent to bit 2 of HCR in Loopback mode.
5	<b>DSR (Data Set Ready).</b> This bit is the inverse of the DSR# input and is equivalent to bit 0 of HCR in Loopback mode.
4	<b>CTS (Clear to Send).</b> This bit is the inverse of the CTS# input and is equivalent to bit 1 of HCR in Loopback mode.
3	<b>TDCD (DCD# Toggling).</b> This bit indicates that the state of the DCD# pin has changed after HSR is read by the CPU.
2	<b>FERI (RI Falling Edge).</b> This bit indicates that the RI# pin has changed from low to high after HSR is read by the CPU.
1	<b>TDSR (DSR# Toggling).</b> This bit indicates that the state of the DSR# pin has changed after HSR is read by the CPU.
0	<b>TCTS (CTS# Toggling).</b> This bit indicates that the state of the CTS# pin has changed after HSR is read by the CPU.

### 10.5 UART FIFO Control Register (UFR) (Write only)

This register is used to control the FIFO functions of the UART.

BIT	7	6	5	4	3	2	1	0
NAME	MSB	LSB	RESERVED		DMA MODE SELECT	TRANSMITTER FIFO RESET	RECEIVER FIFO RESET	FIFO ENABLE
DEFAULT	0	0	NA	NA	0	0	0	0

BIT	DESCRIPTION	
7	<b>MSB (RX Interrupt Active Level).</b>	These two bits are used to set the active level of the receiver FIFO interrupt. The active level is the number of bytes that must be in the receiver FIFO to generate an interrupt.
6	<b>LSB (RX Interrupt Active Level).</b>	
5-4	<b>RESERVED.</b>	
3	<b>DMS MODE SELECT.</b> When this bit is set to logic 1, DMA mode changes from mode 0 to mode 1 if UFR bit 0 = 1.	
2	<b>TRANSMITTER FIFO RESET.</b> Setting this bit to logic 1 resets the TX FIFO counter logic to its initial state. This bit is automatically cleared afterwards.	
1	<b>RECEIVER FIFO RESET.</b> Setting this bit to logic 1 resets the RX FIFO counter logic to its initial state. This bit is automatically cleared afterwards.	
0	<b>FIFO ENABLE.</b> This bit enables 16550 (FIFO) mode. This bit should be set to logic 1 before other UFR bits are programmed.	

BIT 7	BIT 6	RX FIFO INTERRUPT ACTIVE LEVEL (BYTES)
0	0	01
0	1	04
1	0	08
1	1	14

### 10.6 Interrupt Status Register (ISR) (Read only)

This register reflects the UART interrupt status.

BIT	7	6	5	4	3	2	1	0
NAME	FIFOS ENABLED		RESERVED		INTERRUPT STATUS BIT 2	INTERRUPT STATUS BIT 1	INTERRUPT STATUS BIT 0	0 IF INTERRUPT PENDING
DEFAULT	0	0	0	0	0	0	0	1

BIT	DESCRIPTION
7-6	<b>FIFOS ENABLED.</b> Set to logical 1 when UFR, bit 0 = 1.
5-4	<b>RESERVED.</b>
3	<b>INTERRUPT STATUS BIT 2.</b> In 16450 mode, this bit is logical 0. In 16550 mode, bits 3 and 2 are set to logical 1 when a time-out interrupt is pending. Please see the table below.

**PRELIMINARY**

2	<b>INTERRUPT STATUS BIT 1.</b>	These two bits identify the priority level of the pending interrupt, as shown in the table below.
1	<b>INTERRUPT STATUS BIT 0.</b>	
0	<b>0 IF INTERRUPT PENDING.</b> This bit is logic 1 if there is no interrupt pending. If one of the interrupt sources has occurred, this bit is set to logical 0.	

ISR				INTERRUPT SET AND FUNCTION			
Bit 3	Bit 2	Bit 1	Bit 0	Interrupt priority	Interrupt Type	Interrupt Source	Clear Interrupt
0	0	0	1	-	-	No Interrupt pending	-
0	1	1	0	First	UART Receive Status	1. OER = 1 2. PBER =1 3. NSER = 1 4. SBD = 1	Read USR
0	1	0	0	Second	RBR Data Ready	1. RBR data ready 2. FIFO interrupt active level reached	1. Read RBR 2. Read RBR until FIFO data under active level
1	1	0	0	Second	FIFO Data Timeout	Data present in RX FIFO for 4 characters period of time since last access of RX FIFO.	Read RBR
0	0	1	0	Third	TBR Empty	TBR empty	1. Write data into TBR 2. Read ISR (if priority is third)
0	0	0	0	Fourth	Handshake status	1. TCTS = 1 2. TDSR = 1 3. FERI = 1 4. TDCD = 1	Read HSR

\*\* Bit 3 of ISR is enabled when bit 0 of UFR is logical 1.

**10.7 Interrupt Control Register (ICR) (Read/Write)**

This 8-bit register enables and disables the five types of controller interrupts separately. A selected interrupt can be enabled by setting the appropriate bit to logical 1. The interrupt system can be totally disabled by setting bits 0 through 3 to logical 0.

BIT	7	6	5	4	3	2	1	0
NAME	En_address_byte	RX_ctrl	RESERVED		EHSRI	EUSRI	ETBREI	ERDRI
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	<b>En_address_byte.</b> 0: Tx block will send data byte. (If enable 9bit mode function CRF2 Bit0=1) 1: Tx block will send address byte. (If enable 9bit mode function CRF2 Bit0=1)
6	<b>RX_ctrl.</b> 0: Rx block could receive data byte. (If enable 9bit mode function CRF2 Bit0=1) 1: Rx block could receive address byte. (If enable 9bit mode function CRF2 Bit0=1)
5-4	<b>RESERVED.</b>
3	<b>EHSRI (Handshake Status Interrupt Enable).</b> Set this bit to logical 1 to enable the handshake status register interrupt.
2	<b>EUSRI (UART Receive Status Interrupt Enable).</b> Set this bit to logical 1 to enable the UART status register interrupt.
1	<b>ETBREI (TBR Empty Interrupt Enable).</b> Set this bit to logical 1 to enable the TBR empty

**PRELIMINARY**

BIT	DESCRIPTION
	interrupt.
0	<b>ERDRI (RBR Data Ready Interrupt Enable).</b> Set this bit to logical 1 to enable the RBR data ready interrupt.

**10.8 Programmable Baud Generator (BLL/BHL) (Read/Write)**

Two 8-bit registers, BLL and BHL, compose a programmable baud generator that uses 24 MHz to generate a 1.8461 MHz frequency and divide it by a divisor from 1 to ( $2^{16} - 1$ ). The output frequency of the baud generator is the baud rate multiplied by 16, and this is the base frequency for the transmitter and receiver. The table below illustrates the use of the baud generator with a frequency of 1.8461 MHz. In high-speed UART mode (CR0C, bits 7 and 6), the programmable baud generator directly uses 24 MHz and the same divisor as the normal speed divisor. As a result, in high-speed mode, the data transmission rate can be as high as 1.5M bps.

BAUD RATE FROM DIFFERENT PRE-DIVIDER				
PRE-DIV: 13 1.8461M HZ	PRE-DIV:1.625 14.769M HZ	PRE-DIV: 1.0 24M HZ	DECIMAL DIVISOR USED TO GENERATE 16X CLOCK	ERROR PERCENTAGE
50	400	650	2304	**
75	600	975	1536	**
110	880	1430	1047	0.18%

7200	57600	93600	16	**
9600	76800	124800	12	**
19200	153600	249600	6	**
38400	307200	499200	3	**
57600	460800	748800	2	**
115200	921600	1497600	1	**

\*\* Unless specified, the error percentage for all of the baud rates is 0.16%.

Note: Pre-Divisor is determined by CRF0 of UART A and B.

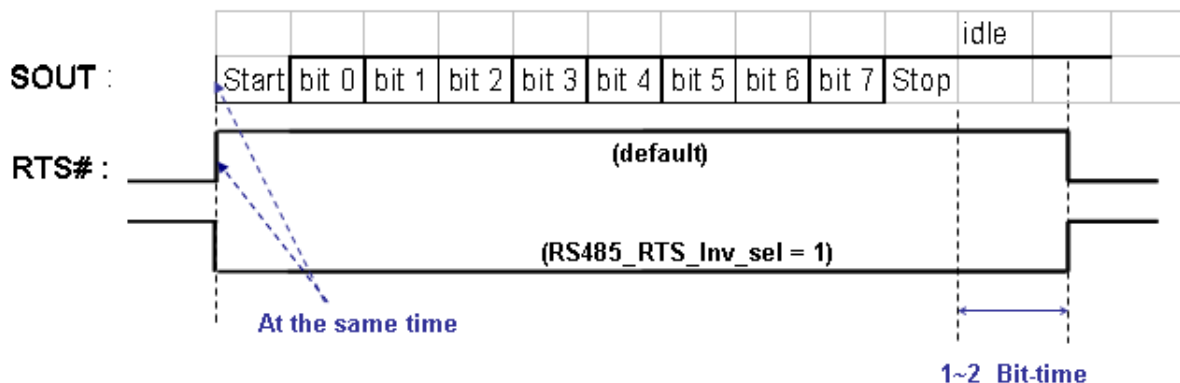

**10.9 User-defined Register (UDR) (Read/Write)**

This is a temporary register that can be accessed and defined by the user.

### 10.10 UART RS485 Auto Flow Control

NCT5532D supports RS485 auto flow control function for UARTA. When enabling the RS485 auto control function, it will automatically drive RTS# pin to logic high or low for UARTA when UART TX block transmits the data.

The diagram shown below illustrates the RS485 auto flow control function for UARTA.

The default behavior of RTS# pin will drive logic high the time edge between **Start bit** and **bit0** when the UART TX Block start to transmits the data on SOUT pin. Then the RTS# pin will drive logic low later than **Stop bit** about 1~2 x Bit-time when UART TX Block completes the data transmission. The driving behavior of RTS# will be inverted when we set RS485\_RTS\_inv\_sel bit = 1'b1. (Bit-time: Depends on the baud rate of transmission)

The following control register table relates to the RS485 auto flow control function for UARTA.

	UARTA
RTS485_enable	Logic Device 2, CRF2_Bit7
RTS485_inv_sel	Logic Device 2, CRF2_Bit6

## 11. KEYBOARD CONTROLLER

The NCT5532D KBC (8042 with licensed KB BIOS) circuit is designed to provide the functions needed to interface a CPU with a keyboard and/or a PS/2 mouse and can be used with IBM®-compatible personal computers or PS/2-based systems. The controller receives serial data from the keyboard or PS/2 mouse, checks the parity of the data, and presents the data to the system as a byte of data in its output buffer. Then, the controller asserts an interrupt to the system when data are placed in its output buffer. The keyboard and PS/2 mouse are required to acknowledge all data transmissions. No transmission should be sent to the keyboard or PS/2 mouse until an acknowledgement is received for the previous data byte.

Figure 11-1 Keyboard and Mouse Interface

### 11.1 Output Buffer

The output buffer is an 8-bit, read-only register at I/O address 60H (Default, PnP programmable I/O address LD5-CR60 and LD5-CR61). The keyboard controller uses the output buffer to send the scan code (from the keyboard) and required command bytes to the system. The output buffer can only be read when the output buffer full bit in the register (in the status register) is logical 1.

### 11.2 Input Buffer

The input buffer is an 8-bit, write-only register at I/O address 60h or 64h (Default, PnP programmable I/O address LD5-CR60, LD5-CR61, LD5-CR62, and LD5-CR63). Writing to address 60h sets a flag to indicate a data write; writing to address 64h sets a flag to indicate a command write. Data written to I/O address 60h is sent to the keyboard (unless the keyboard controller is expecting a data byte) through the controller's input buffer only if the input buffer full bit (in the status register) is logical 0.

### 11.3 Status Register

The status register is an 8-bit, read-only register at I/O address 64h (Default, PnP programmable I/O address LD5-CR62 and LD5-CR63) that holds information about the status of the keyboard controller and interface. It may be read at any time.

Table 11-1 Bit Map of Status Register

BIT	BUT FUNCTION	DESCRIPTION
0	Output Buffer Full	0: Output buffer empty 1: Output buffer full
1	Input Buffer Full	0: Input buffer empty 1: Input buffer full
2	System Flag	This bit may be set to 0 or 1 by writing to the system flag bit in the command byte of the keyboard controller. It defaults to 0 after a power-on reset.
3	Command/Data	0: Data byte 1: Command byte
4	Inhibit Switch	0: Keyboard is inhibited 1: Keyboard is not inhibited
5	Auxiliary Device Output Buffer	0: Auxiliary device output buffer empty 1: Auxiliary device output buffer full
6	General Purpose Time-out	0: No time-out error 1: Time-out error
7	Parity Error	0: Odd parity 1: Even parity (error)

Adh	Disable Keyboard Interface																		

**PRELIMINARY**

<b>COMMAND</b>	<b>FUNCTION</b>
Aeh	Enable Keyboard Interface
C0h	Read Input Port (P1) and send data to the system
C1h	Continuously puts the lower four bits of Port1 into the STATUS register
C2h	Continuously puts the upper four bits of Port1 into the STATUS register
D0h	Send Port 2 value to the system
D1h	Only set / reset GateA20 line based on system data bit 1
D2h	Send data back to the system as if it came from the Keyboard
D3h	Send data back to the system as if it came from Auxiliary Device
D4h	Output next received byte of data from system to Auxiliary Device
E0h	Reports the status of the test inputs
FXh	Pulse only RC (the reset line) low for 6 $\mu$ s if the Command byte is even

### 11.5 Hardware GATEA20/Keyboard Reset Control Logic

The KBC includes hardware control logic to speed-up GATEA20 and KBRESET. This control logic is controlled by LD5-CRF0 as follows:

#### 11.5.1 KB Control Register (Logic Device 5, CR-F0)

BIT	7	6	5	4	3	2	1	0
NAME	KCLKS1	KCLKS0	RESERVED			P92EN	HGA20	HKBRST#
DEFAULT	1	0	0	0	0	0	0	0

BIT	DESCRIPTION	
7	<b>KCLKS1.</b>	Select the KBC clock rate. <b>Bits</b> <b>7 6</b> 0 0: Reserved 0 1: Reserved
6	<b>KCLKS0.</b>	1 0: KBC clock input is 12 MHz. 1 1: Reserved
5-3	<b>RESERVED.</b>	
2	<b>P92EN (Port 92 Enable).</b> 1: Enables Port 92 to control GATEA20 and KBRESET. 0: Disables Port 92 functions.	
1	<b>HGA20 (Hardware GATEA 20).</b> 1: Selects hardware GATE A20 control logic to control GATE A20 signal. 0: Disables GATEA20 control logic functions.	
0	<b>HKBRST# (Hardware Keyboard Reset).</b> 1: Selects hardware KB RESET control logic to control KBRESET signal. 0: Disables hardware KB RESET control logic function.	

When the KBC receives data that follows a “D1” command, the hardware control logic sets or clears GATE A20 according to received data bit 1. Similarly, the hardware control logic sets or clears KBRESET depending on received data bit 0. When the KBC receives an “FE” command, the KBRESET is pulse low for 6 μs (Min.) with a 14 μs (Min.) delay.

GATE A20 and KBRESET are controlled by either software or hardware logic, and they are mutually exclusive. Then, GATE A20 and KBRESET are merged with Port92 when the P92EN bit is set.

11.5.2 Port 92 Control Register (Default Value = 0x24)

BIT	7	6	5	4	3	2	1	0
NAME	RES. (0)		RES. (1)	RES. (0)		RES. (1)	SGA20	PLKBRST#
DEFAULT	0	0	1	0	0	1	0	0

BIT	DESCRIPTION
7-6	RES. (0)
5	RES. (1)
4-3	RES. (0)
2	RES. (1)
1	<b>SGA20 (Special GATE A20 Control)</b> 1: Drives GATE A20 signal to high. 0: Drives GATE A20 signal to low.
0	<b>PLKBRST# (Pulled-low KBRESET).</b> A logical 1 on this bit causes KBRESET to drive low for 6 $\mu$ S(Min.) with a 14 $\mu$ S(Min.) delay. Before issuing another keyboard-reset command, the bit must be cleared.

## 12. CONSUMER INFRARED REMOTE (CIR)

Regarding the receiving of IR Block, the hardware uses the sampling rates of 1us, 25us, 50us and 100us to calculate the widths of H Level and L Level. The results are saved/stored in 32\*8 RX FIFO. The max widths of H Level and L Level will be determined by Sample Limit Count Register. During the receiving, the hardware will reflect the FIFO status in RX FIFO Status Register. In addition, the hardware also generates status, such as Data Ready, Trigger Level Reach, FIFO Overrun and FIFO underrun, in RC Status Register.

As for the transmission, the user has to set up the Carrier frequency and the transmission mode first and then writes the widths of H Level and L Level via TX FIFO. The hardware will add Carrier to H Level according to the transmission mode.

### 12.1 CIR Register Table

Table 12-1 CIR Register Table

RC Block										
ExtAddr	Name	7	6	5	4	3	2	1	0	
base+0	IRCON	R	WIREN	TXEN	RXEN	WRXINV	RXINV	Sample Period Select

#### 12.1.1 IR Configuration Register – Base Address + 0

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Received	WIREN	TXEN	RXEN	WRXINV	RXINV	Sample Period Select	
DEFAULT	0	0	0	0	0	1	0	0

BIT	DESCRIPTION
7	Received.
6	Wide-band IR Enable

**PRELIMINARY**

5	<b>TX Enable</b> 1: Transmission Enable. After confirming that FIFO is not empty, the transmission starts (the hardware will wait until TX FIFO data are written). If TX Enable is set to 0 during the transmission, the transmission stops when the transmission of FIFO data is completed. 0: Transmission Disable.
4	<b>RX Enable</b>
3	<b>Wide-band IR Rx Invert Enable</b> 0: Dongle Carrier ON is high, OFF (Idle) is low. 1: Dongle Carrier ON is low, OFF (Idle) is high.
2	<b>IR Rx Invert Enable</b> 0: Dongle Carrier ON is high, OFF (Idle) is low. 1: Dongle Carrier ON is low, OFF (Idle) is high.
1~0	<b>Sample Period Select</b> 00:1us, 01: 25us, 10: 50us, 11: 100us Note: In the 1us mode, the pulse mode will not function due to the IR regulations.

**12.1.2 IR Status Register – Base Address + 1**

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
Name	RDR	RTR	PE	RFO	TE	TTR	TFU	GH
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	<b>RX Data Ready</b> (Writing 1 will clear the bit).
6	<b>RX FIFO Trigger Level Reach</b> (Writing 1 will clear the bit).
5	<b>Packet End</b> (Writing 1 will clear the bit).
4	<b>RX FIFO Overrun</b> (Overrun and Data Ready will be simultaneously generated. Writing 1 will clear the bit).
3	<b>TX FIFO Empty</b> (Writing 1 will clear the bit).
2	<b>TX FIFO Trigger Level Reach</b> (Writing 1 will clear the bit).
1	<b>TX FIFO Underrun</b> (Writing 1 will clear the bit).
0	<b>Min Length Detected</b> (Writing 1 will clear the bit) 1: The IR Data length received is shorter than the default value. 0: The IR Data length received is longer than the default value.

**12.1.3 IR Interrupt Configuration Register – Base Address + 2**

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
-----	---	---	---	---	---	---	---	---

**PRELIMINARY**

NAME	RDR	RTR	PE	RFO	TE	TTR	TFU	GH
DEFAULT	0	0	0	0	0	0	0	0

1: Enable interrupt; 0: Disable interrupt

BIT	DESCRIPTION
7	RX Data Ready
6	RX FIFO Trigger Level Reach
5	Packet End
4	RX FIFO Overrun (Overrun and Data Ready will be simultaneously generated).
3	TX FIFO Empty
2	TX FIFO Trigger Level Reach
1	TX FIFO Underrun
0	Min Length Detected

Note. When an Interrupt occurs, it only can be cleared by writing IR Status Register to 1.

**12.1.4 RX FIFO Count– Base Address + 5**

Attribute: Read

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	FIFO Count							
DEFAULT	0	0	0	0	0	0	0	0

1: Enable; 0: Disable

BIT	DESCRIPTION
7~0	RX FIFO Count

**12.1.5 IR TX Carrier Prescalar Configuration Register (CP) – Base Address + 4**

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Mode	Reserved						CP
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	<b>Mode</b> 0 : DC Mode 1 : Pulse Mode
6~1	<b>Reserved.</b>

**PRELIMINARY**

0	<b>Carrier Prescalar (CP).</b> This bit is set for the Prescalar value of the IR TX carrier frequency.
---	--

**12.1.6 IR TX Carrier Period Configuration Register (CC) – Base Address + 5**

Attribute: Read/Write

Size: 8 bits

<b>BIT</b>	7	6	5	4	3	2	1	0
<b>NAME</b>	<b>Carrier Period (CC)</b>							
<b>DEFAULT</b>	0	0	0	0	0	0	0	0

<b>BIT</b>	<b>DESCRIPTION</b>
7~0	This byte is set for IR TX carrier period. The actual carrier period will be: $Period = 2 * (2 ^ (CP*2)) * (CC+1) / (System\ Clock)$ , where the frequency = 1 / period, and System Clock = 24MHz. Setting CP and CC to 0 will cause stop the device to from use using anyno carrier at all (that is, no light modulation, just constant on and off periods). The period count value CC can be any number from 0 to 255.

**12.1.7 IR RX Sample Limited Count High Byte Register (RCLCH) – Base Address + 6**

Attribute: Read/Write

Size: 8 bits

<b>BIT</b>	7	6	5	4	3	2	1	0
<b>NAME</b>	<b>Sample Limited Count High Byte</b>							
<b>DEFAULT</b>	0	0	0	0	0	0	0	0

<b>BIT</b>	<b>DESCRIPTION</b>
7~0	This byte is defined as the high byte of the limited count in the IR RX mode.

**12.1.8 IR RX Sample Limited Count Low Byte Register (RCLCL) – Base Address + 7**

Attribute: Read/Write

Size: 8 bits

<b>BIT</b>	7	6	5	4	3	2	1	0
<b>NAME</b>	<b>Sample Limited Count low Byte</b>							
<b>DEFAULT</b>	0	0	0	0	0	0	0	0

<b>BIT</b>	<b>DESCRIPTION</b>
7~0	This byte is defined as the low byte of the limited count in the IR RX mode.

Note. (RCLCH, RCLCL) is defined as 16 bits value of the limited count in the IR RX mode. When the RX date length reaches the limited count, Packet End status will appear.

**12.1.9 IR FIFO Configuration Register (FIFOCON) – Base Address + 8**

**PRELIMINARY**

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	TXFIFOCLR	Reserved	TX Trigger Level		RXFIFOCLR	Reserved	RX Trigger Level	
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	<b>TX FIFO Cleared.</b>
6	<b>Reserved.</b>
5~4	<b>TX Trigger Level Bits</b> 5 4 0 0: 31 0 1: 24 1 0: 16 1 1: 8
3	<b>RX FIFO Cleared.</b>
2	<b>Reserved.</b>
1~0	<b>RX Trigger Level Bits</b> 1 0 0 0: 1 0 1: 8 1 0: 16 1 1: 24

**12.1.10IR Sample RX FIFO Status Register – Base Address + 9**

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	IR_Pending	RX_GS	RX_FTA	RX_Empty	RX_Full	TX_FTA	TX_Empty	TX_Full
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	<b>IR Pending</b> 1: No Interrupt 0: Interrupt issue
6	<b>Minimum Length Detect Status.</b> This bit will be cleared when Packet End appears.
5	<b>RX FIFO Trigger Level Active.</b>
4	<b>RX FIFO Empty Flag.</b>
3	<b>RX FIFO Full Flag.</b>

**PRELIMINARY**

BIT	DESCRIPTION
2	TX FIFO Trigger Level Active.
1	TX FIFO Empty Flag.
0	TX FIFO Full Flag.

**12.1.11IR Sample RX FIFO Register – Base Address + A**

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Voltage Level	Sample RX FIFO						

BIT	DESCRIPTION
7	<b>Voltage Level</b> 0: Low, 1: High
6~0	<b>RX data length</b> (Unit : Sample Period) Note: 1. 0x80 is Packet End. The hardware enters the Idle state after checking Rx Channel. 2. When 0x00 represents the glitch packet, it means pulses shorter than 3/4 sample period are received. 3. Pulses that are shorter than 1/4 sample periods will be ignored automatically.

**12.1.12TX FIFO Count– Base Address + 5**

Attribute: Read

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	TX FIFO Count							
DEFAULT	0	0	0	0	0	0	0	0

1: Enable; 0: Disable

BIT	DESCRIPTION
7~0	TX FIFO Count

**12.1.13IR Sample TX FIFO Register – Base Address + C**

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Voltage Level	Sample TX FIFO						

**PRELIMINARY**

BIT	DESCRIPTION
7	<b>Voltage Level</b> 0: Low, 1: High
6~0	<b>TX data length</b> (Unit : Sample Period)

**12.1.14IR Carrier Count High Byte Register – Base Address + D**

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Carrier Count High Byte							

BIT	DESCRIPTION
7~0	<b>Carrier Count High Byte.</b> This byte records the total amount of the total rising edges until time-out event appears.

**12.1.15IR Carrier Count Low Byte Register – Base Address + E**

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Carrier Count Low Byte							

BIT	DESCRIPTION
7~0	<b>Carrier Count Low Byte.</b> This byte records the total amount of the the rising edges until time-out event appears.

After a time-out of reception on the learning receiver, this response is sent to tell the host the carrier frequency of the previous sample. The Carrier Count High Byte (ch) and Carrier Count Low Byte (cl) specify the cycle counts of cycles of the carrier. Carrier counts can also be thought of regarded as the number of leading edges in the previous sample.

This is used to calculation of the calculate carrier frequency is as follows followed:

$$\text{lastCarrierCount}_{(\text{decimal})} = \text{ch} * 256 + \text{cl};$$

Thus,

$$\text{Carrier frequency} = (\text{lastCarrierCount}) / (\text{irPacketOnDuration});$$

The **irPacketOnDuration** value is the total amount of time that the envelope of the signal was is high. The IR receiver should keep track of the time that of the high envelope is high and return it using this response.

This response is unsolicited. It is returned by the receiver when IR arrives but is never explicitly requested.

**12.1.16IR FSM Status Register (IRFSM) – Base Address + F**

Attribute: Read Only

Size: 8 bits

**PRELIMINARY**

<b>BIT</b>	7	6	5	4	3	2	1	0
<b>NAME</b>	Reserved	Decoder FSM			Reserved	Encoder FSM		
<b>DEFAULT</b>	0	0	0	0	0	0	0	0

<b>BIT</b>	<b>DESCRIPTION</b>
7	Reserved.
6	Decoder over status
5	Decoder continuing status
4	Decoder wait H status 1: idle, 0: RX busy
3	Reserved.
2	Encoder Idle Status. 1: idle, 0: TX busy
1	Encoder Read Status
0	Encoder Level Output Status

**12.1.17IR Minimum Length Register – Base Address + F**

Attribute: Write Only

Size: 8 bits

<b>BIT</b>	7	6	5	4	3	2	1	0
<b>NAME</b>	Min Length Register							
<b>DEFAULT</b>	0	0	0	0	0	0	0	0

<b>BIT</b>	<b>DESCRIPTION</b>
7~0	<b>Min Length Register.</b> Set up the shortest expected length of each carrier on the RX receiver (Unit: Sample Clock).

### 13. CONSUMER INFRARED REMOTE (CIR) WAKE-UP

One of the features of the NCT5532D is system boot-up by a remote controller. The hardware will store a specifically appointed key command from the IR remote controller in the FIFO of 67Byte.

The same key is required to re-boot the system after the computer shut-down. Such way can be applied to any remote controllers. Learning is necessary only at the first time.

#### 13.1 CIR WAKE-UP Register Table

RC Block										
ExtAddr	Name	7	6	5	4	3	2	1	0	
base+0	IRCON	DEC_RST	Mode[1]	Mode[0]	RXEN	IgnoreEN	RXINV	Sample Period Select

6~4	CIR State Machine
3~1	Reserved
0	<b>Wake up event:</b> 0: CIR wake up event has not been triggered. 1: CIR wake up event has been triggered. (Wake up event clear: Write 11b to “Logic Decice A, CRE8h, bit7~6” then 00b.)

**13.1.17IR Minimum Length Register – Base Address + F**

Attribute: Write Only

Size: 8 bits

<b>BIT</b>	7	6	5	4	3	2	1	0
<b>NAME</b>	Min Length Register							
<b>DEFAULT</b>	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7~0	Min Length Register. Set up the shortest expected length of each carrier on the RX receiver (Unit: Sample Clock).

### 14. POWER MANAGEMENT EVENT

The PME# signal is connected to the South Bridge and is used to wake up the system from S1 ~ S5 sleeping states.

One control bit and four registers in the NCT5532D are associated with the PME function. The control bit is at Logical Device A, CR[F2h], bit[0] and is for enabling or disabling the PME function. If this bit is set to “0”, the NCT5532D won’t output any PME signal when any of the wake-up events has occurred and is enabled. The four registers are divided into PME status registers and PME interrupt registers of wake-up events <sup>Note.1</sup>.

- 1) The PME status registers of wake-up event:
  - At Logical Device A, CR[F3h] and CR[F4h]
  - Each wake-up event has its own status
  - The PME status should be cleared by writing a “1” before enabling its corresponding bit in the PME interrupt registers
- 2) The PME interrupt registers of wake-up event:
  - At Logical Device A, CR[F6h] and CR[F7h]
  - Each wake-up event can be enabled / disabled individually to generate a PME# signal

Note.1 PME wake-up events that the NCT5532D supports include:

- Mouse event\*
- Keyboard event\*
- GP41 events \*
- CIR\*
- UART A IRQ event
- IR IRQ event
- Hardware Monitor IRQ event
- WDT1 event
- RIA (UARTA Ring Indicator) event

Note.2 All the above support both S0 and S1 states. Events with the “\*” mark also support S3 ~ S5 states.

#### 14.1 Power Control Logic

This chapter describes how the NCT5532D implements its ACPI function via these power control pins: PSIN#, PSOUT#, SLP\_S3# and PSON#. The following figure illustrates the relationships.

Figure 14-1 Power Control Mechanism

14.1.1 PS0N# Logic

14.1.1.1. Normal Operation

The PS0UT# signal will be asserted low if the PSIN# signal is asserted low. The PS0UT# signal is held low for as long as the PSIN# is held low. The South Bridge controls the SLP\_S3# signal through the PS0UT# signal. The PS0N# is directly connected to the power supply to turn on or off the power.

Figure 14-2 shows the power on and off sequences.

The ACPI state changes from S5 to S0, then to S5

Figure 14-2 Power Sequence from S5 to S0, then Back to S5

14.1.2 AC Power Failure Resume

By definition, AC power failure means that the standby power is removed. The power failure resume control logic of the NCT5532D is used to recover the system to a pre-defined state after AC power failure. Two control bits at Logical Device A, CR[E4h], bits[6:5] indicate the pre-defined state. The definition of these two bits is listed in the following table:

Table 14-1 Bit Map of Logical Device A, CR[E4h], Bits[6:5]

PRELIMINARY

LOGICAL DEVICE A, CR[E4H], BITS[6 :5]	DEFINITION
00	System always turns off when it returns from AC power failure
01	System always turns on when it returns from AC power failure
10	System turns off / on when it returns from power failure depending on the state before the power failure. (Please see Note 1)
11	User defines the state before the power failure. (The previous state is set at CRE6[4]. Please see Note 2)

Note1. The NCT5532D detects the state before power failure (on or off) through the SLP\_S3# signal and the 3VCC power. The relation is illustrated in the following two figures.

Figure 14-3 The previous state is “on”  
3VCC falls to 2.6V and SLP\_S3# keeps at 2.0V.

Figure 14-4 The previous state is “off”.  
3VCC falls to 2.6V and SLP\_S3# keeps at 0.8V.

Note 2.

Logical Device A, CR[E6h] bit [4]	Definition
0	User defines the state to be “on”
1	User defines the state to be “off”

To ensure that VCC does not fall faster than VSB in various ATX Power Supplies, the NCT5532D adds the option of “user define mode” for the pre-defined state before AC power failure. BIOS can set the pre-defined state to be “On” or “Off”. According to this setting, the system is returned to the pre-defined state after the AC power recovery.

## 14.2 Wake Up the System by Keyboard and Mouse

**PRELIMINARY**

The NCT5532D generates a low pulse through the PSOUT# pin to wake up the system when it detects a key code pressed or mouse button clicked. The following sections describe how the NCT5532D works.

**14.2.1 Waken up by Keyboard events**

The keyboard Wake-Up function is enabled by setting Logical Device A, CR[E0h], bit 6 to “1”.

There are two keyboard events can be used for the wake-up

- 1) Any key – Set bit 0 at Logical Device A, CR[E0h] to “1” (Default).
- 2) Specific keys (Password) – Set bit 0 at Logical Device A, CR[E0h] to “0”.

Three sets of specific key combinations are stored at Logical Device A. CR[E1h] is an index register to indicate which byte of key code storage (0x00h ~ 0x0Eh, 0x30h ~ 0x3Eh, 0x40h ~ 0x4Eh) is going to be read or written through CR[E2h]. According to IBM 101/102 keyboard specification, a complete key code contains a 1-byte make code and a 2-byte break code. For example, the make code of “0” is 0x45h, and the corresponding break code is 0xF0h, 0x45h.

The approach to implement Keyboard Password Wake-Up Function is to fill key codes into the password storage. Assume that we want to set “012” as the password. The storage should be filled as below. Please note that index 0x09h ~ 0x0Eh must be filled as 0x00h since the password has only three numbers.

Index(CRE1)→	00	01	02	03	04	05	06	07	08	09	0A	0B	0C	0D	0E
Data(CRE2)→	1E	F0	1E	16	F0	16	45	F0	45	00	00	00	00	00	00

**14.2.2 Waken up by Mouse events**

The mouse Wake-Up function is enabled by setting Logical Device A, CR[E0h], bit 5 to “1”.

The following specific mouse events can be used for the wake-up:

- Any button clicked or any movement
- One click of the left or the right button
- One click of the left button
- One click of the right button
- Two clicks of the left button
- Two clicks of the right button.

Three control bits (ENMDAT\_UP, MSRKEY, MSXKEY) define the combinations of the mouse wake-up events. Please see the following table for the details.

Table 14-2 Definitions of Mouse Wake-Up Events

ENMDAT_UP (LOGICAL DEVICE A, CR[E6H], BIT 7)	MSRKEY (LOGICAL DEVICE A, CR[E0H], BIT 4)	MSXKEY (LOGICAL DEVICE A, CR[E0H], BIT 1)	WAKE-UP EVENT
--	---	--	---------------

ENMDAT_UP (LOGICAL DEVICE A, CR[E6H], BIT 7)	MSRKEY (LOGICAL DEVICE A, CR[E0H], BIT 4)	MSXKEY (LOGICAL DEVICE A, CR[E0H], BIT 1)	WAKE-UP EVENT
1	x	1	Any button clicked or any movement.
1	x	0	One click of the left or right button.
0	0	1	One click of the left button.
0	1	1	One click of the right button.
0	0	0	Two clicks of the left button.
0	1	0	Two clicks of the right button.

### 14.3 Resume Reset Logic

The RSMRST# signal is a reset output and is used as the VSB power on reset signal for the South Bridge.

When the NCT5532D detects the 3VSB voltage rises to “V1”, it then starts a delay – “t1” before the rising edge of RSMRST# asserting. If the 3VSB voltage falls below “V2”, the RSMRST# de-asserts immediately.

Timing and voltage parameters are shown in Figure 14-5 and Table 14-3.

Figure 14-5 Mechanism of Resume Reset Logic

Table 14-3 Timing and Voltage Parameters of RSMRST#

NAME	PARAMETER	MIN.	MAX.	UNIT
V1	3VSB Valid Voltage	-	3.033	V
V2	3VSB Ineffective Voltage	2.882	-	V
t1	Valid 3VSB to RSMRST# inactive	100	200	mS

### 15. SERIALIZED IRQ

The NCT5532D supports a serialized IRQ scheme. This allows a signal line to be used to report the parallel interrupt requests. Since more than one device may need to share the signal serial SERIRQ signal, an open drain signal scheme is employed. The clock source is the PCI clock. The serialized interrupt is transferred on the SERIRQ signal, one cycle consisting of three frames types: the Start Frame, the IRQ/Data Frame, and the Stop Frame.

#### 15.1 Start Frame

There are two modes of operation for the SERIRQ Start Frame: Quiet mode and Continuous mode.

In the Quiet mode, the NCT5532D drives the SERIRQ signal active low for one clock, and then tri-states it. This brings all the state machines of the NCT5532D from idle to active states. The host controller (the South Bridge) then takes over driving SERIRQ signal low in the next clock and continues driving the SERIRQ low for programmable 3 to 7 clock periods. This makes the total number of clocks low 4 to 8 clock periods. After these clocks, the host controller drives the SERIRQ high for one clock and then tri-states it.

In the Continuous mode, the START Frame can only be initiated by the host controller to update the information of the IRQ/Data Frame. The host controller drives the SERIRQ signal low for 4 to 8 clock periods. Upon a reset, the SERIRQ signal is defaulted to the Continuous mode for the host controller to initiate the first Start Frame.

Please see the diagram below for more details.

Start Frame Timing with source sampled a low pulse on IRQ1.

Figure 15-1 Start Frame Timing with Source Sampled A Low Pulse on IRQ1

H=Host Control      SL=Slave Control      R=Recovery      T=Turn-around      S=Sample

Note:

1. The Start Frame pulse can be 4-8 clocks wide.
2. The first clock of Start Frame is driven low by the NCT5532D because IRQ1 of the NCT5532D needs an interrupt request. Then the host takes over and continues to pull the SERIRQ low.

**PRELIMINARY**

**15.2 IRQ/Data Frame**

Once the Start Frame has been initiated, the NCT5532D must start counting frames based on the rising edge of the start pulse. Each IRQ/Data Frame has three clocks: the Sample phase, the Recovery phase, and the Turn-around phase.

During the Sample phase, the NCT5532D drives SERIRQ low if the corresponding IRQ is active. If the corresponding IRQ is inactive, then SERIRQ must be left tri-stated. During the Recovery phase, the NCT5532D device drives the SERIRQ high. During the Turn-around phase, the NCT5532D device leaves the SERIRQ tri-stated. The NCT5532D starts to drive the SERIRQ line from the beginning of "IRQ0 FRAME" based on the rising edge of PCICLK.

The IRQ/Data Frame has a specific numeral order, as shown in Table 15-1.

Table 15-1 SERIRQ Sampling Periods

SERIRQ SAMPLING PERIODS			
IRQ/DATA FRAME	SIGNAL SAMPLED	# OF CLOCKS PAST START	EMPLOYED BY
1	IRQ0	2	Reserved
2	IRQ1	5	Keyboard
3	SMI#	8	H/W Monitor & SMI
4	IRQ3	11	IR
5	IRQ4	14	UART A
6	IRQ5	17	-
7	IRQ6	20	Reserved
8	IRQ7	23	Reserved
9	IRQ8	26	-
10	IRQ9	29	-
11	IRQ10	32	-
12	IRQ11	35	-
13	IRQ12	38	Mouse
14	IRQ13	41	Reserved
15	IRQ14	44	-
16	IRQ15	47	-
17	IOCHCK#	50	-
18	INTA#	53	-
19	INTB#	56	-
20	INTC#	59	-
21	INTD#	62	-
32:22	Unassigned	95	-

**15.3 Stop Frame**

**PRELIMINARY**

After all IRQ/Data Frames have completed, the host controller will terminate SERIRQ with a Stop frame. Only the host controller can initiate the Stop Frame by driving SERIRQ low for 2 or 3 clocks. If the Stop Frame is low for 2 clocks, the Sample mode of next SERIRQ cycle's Sample mode is the Quiet mode. If the Stop Frame is low for 3 clocks, the Sample mode of next SERIRQ cycle is the Continuous mode.

Please see the diagram below for more details.

Stop Frame Timing with Host Using 17 SERIRQ sampling period.

Figure 15-2 Stop Frame Timing with Host Using 17 SERIRQ Sampling Period

H=Host Control                  R=Recovery                  T=Turn-around                  S=Sample                  I= Idle.

Note:

1. There may be none, one or more Idle states during the Stop Frame.
2. The Start Frame pulse of next SERIRQ cycle may or may not start immediately after the turn-around clock of the Stop Frame.

## 16. WATCHDOG TIMER

The Watchdog Timer of the NCT5532D consists of an 8-bit programmable time-out counter and a control and status register. GPIO2, GPIO4, GPIO5, GPIO7 provides an alternative WDT1 function. This function can be configured by the relative GPIO control register. The units of Watchdog Timer counter can be selected at Logical Device 8, CR[F5h], bit[3]. The time-out value is set at Logical Device 8, CR[F6h]. Writing zero disables the Watchdog Timer function. Writing any non-zero value to this register causes the counter to load this value into the Watchdog Timer counter and start counting down.

When Watchdog Timer 1 time-out event is occurring, GPIO2, GPIO4, bit[0] & [4] and GPIO7, bit[0] will trigger a low pulse approx 100mS or low level by Logical Device 8 CR[F5h], bit[0]. In other words, when the value is counted down to zero, the timer stops, and the NCT5532D sets the WDT1 status bit in Logical Device 8, CR[F7h], bit[4]. Writing a zero will clear the status bit. It. This bit will also be cleared if LRESET# or PWROK# signal is asserted.

17. GENERAL PURPOSE I/O

17.1 GPIO ARCHITECTURE

The NCT5532D provides 23 input/output ports that can be individually configured to perform a simple basic I/O function or alternative, pre-defined function. Users can configure each individual port to be an input or output port by programming respective bit in selection register (0 = output, 1 = input). Invert port value by setting inversion register (0 = non-inverse, 1 = inver-se). Port value is read/write through data register.

In addition, only **GP41** is designed to be able to assert **PSOUT#** or **PME#** signal to wake up the system if any of them has any transitions. There are about 16ms debounced circuit inside GP41 and it can be disabled by programming respective bit (LD9, CR[Feh] bit 4~7). The following table gives more detailed register map on GP41.

Table 17-1 Relative Control Registers of GPIO 41 that Support Wake-Up Function

	EVENTROUTE I (PSOUT#)	EVENTROUTE II (PME#)	EVENT DEBOUNCED
	0 : DISABLE 1 : ENABLE	0 : DISABLE 1 : ENABLE	0 : ENABLE 1 : DISABLE

### 17.2 ACCESS CHANNELS

There are two different channels to set up/access the GPIO ports. The first one is the indirect access via register 2E/2F (4E/4F, it depends by HEFRAS trapping). The registers can be read / written only when the respective logical device ID and port number are selected.

The other is the direct access through GPIO register table that can be configured by {CR61, CR60} of logic device 8. The mapped 7 registers are defined in table 17-3. Base address plus 0 to 4 are GPIO registers, base address plus 5 and 6 are watchdog registers. Since the base address is set, the GPIO number can be selected by writing the group number to GSR [INDEX] (GPIO Select Register, #0~#7 for GPIO0 ~ GPIO7 respectively). Then the I/O register, the Data register and the Inversion register are mapped to addresses Base+0, Base+1 and Base+2 respectively. Only one GPIO can be accessed at one time.

Table 17-3 GPIO Register Addresses

ADDRESS	ABBR	BIT NUMBER							
		7	6	5	4	3	2	1	0
Base + 0	GSR	Reserved				INDEX			
Base + 1	IOR	GPIO I/O Register							
Base + 2	DAT	GPIO Data Register							
Base + 3	INV	GPIO Inversion Register							
Base + 4	DST	GPIO Status Register							
Base + 5	Wdtmod	Watchdog Timer I (WDT1) and KBC P20 Control Mode Register							
Base + 6	Wdttim	Watchdog Timer I (WDT1) Control Register							

## 18. SMBUS MASTER INTERFACE

### 18.1 General Description

The SMBus interface module is two wire serial interface compatible to the SMBus physical layer. It is also compatible with Intel's SMBus and Philips' I<sup>2</sup>C bus.

The rest of this section introduces the various features of the SMBus master capability. These features are divided into the following sections:

- ◆ SMBus and I<sup>2</sup>C compliant
- ◆ AMD-TSI
- ◆ PCH
- ◆ SMBus master

### 18.2 Introduction to the SMBus Master

#### 18.2.1 Data Transfer Format

Every byte transferred on the bus consists of 8 bits. After the start condition, the master places the 7-bit address to the slave device it wants to address on the bus. The address followed an eight bit indicating the direction of the data transfer (R/W#); a zero indicates a transmission for data while a one indicates a request for data. Each byte is transferred with the most significant bit first, and after each byte, an acknowledge signal must follow. A data transfer is always terminated by stop condition generated by master.

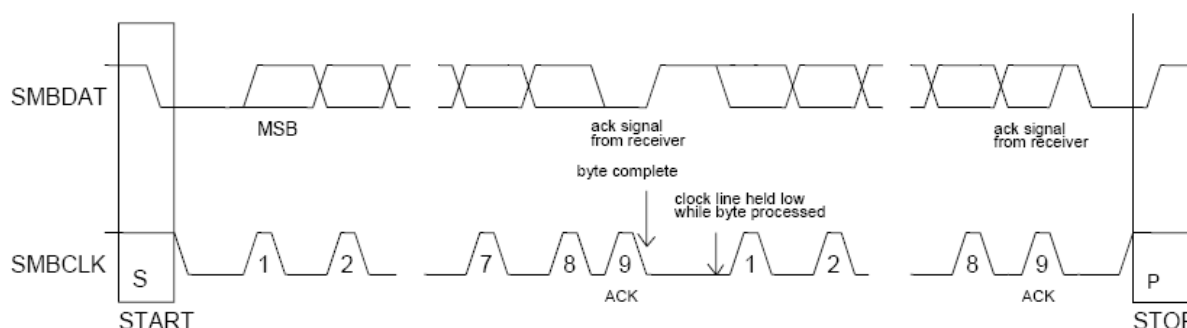

Figure 18-1 Data Transfer Format

#### 18.2.2 Arbitration

Arbitration takes place on the SMBDAT data line while the SMBCLK line is high. Two devices may generate a start condition at the same time and enter the arbitration procedure. Arbitration continues until one master generates a HIGH level on the SMBDAT line while another competing master generates a LOW level on the SMBDAT line while SMBCLK is high. The master device which generated the HIGH level on SMBDAT loses arbitration. If a device loses arbitration during the first byte following a start condition i.e. while transmitting a slave address it becomes a slave receiver and monitors the address for a potential match. Arbitration may also be lost in the master receive mode during the acknowledge cycle.

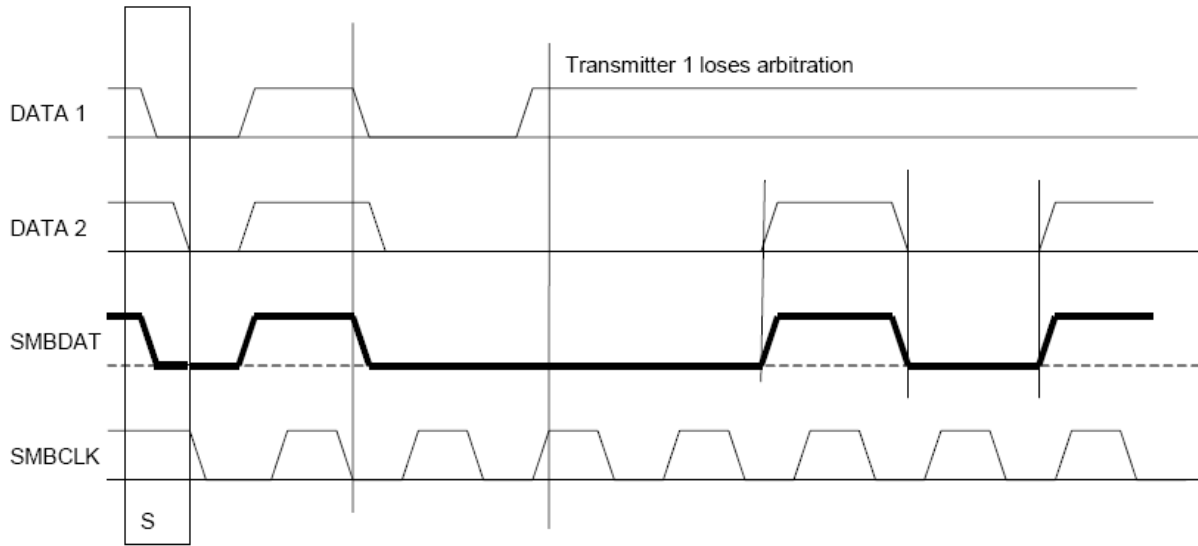

Figure 18-2 SMBus Arbitration

**18.2.3 Clock Synchronization**

Clock synchronization is performed while the arbitration procedure described above is in effect. Clock Synchronization takes place between two competing devices by utilizing the wired-AND nature of the SMBCLK line. The SMBCLK line will go low as soon as the master with the shortest high time pulls SMBCLK low. SMBCLK will remain low until the device with the longest SMBCLK low time relinquishes the SMBCLK line. Therefore the SMBCLK high time is determined by device with the shortest high time while the SMBCLK low time is determined by the device with the longest low time.

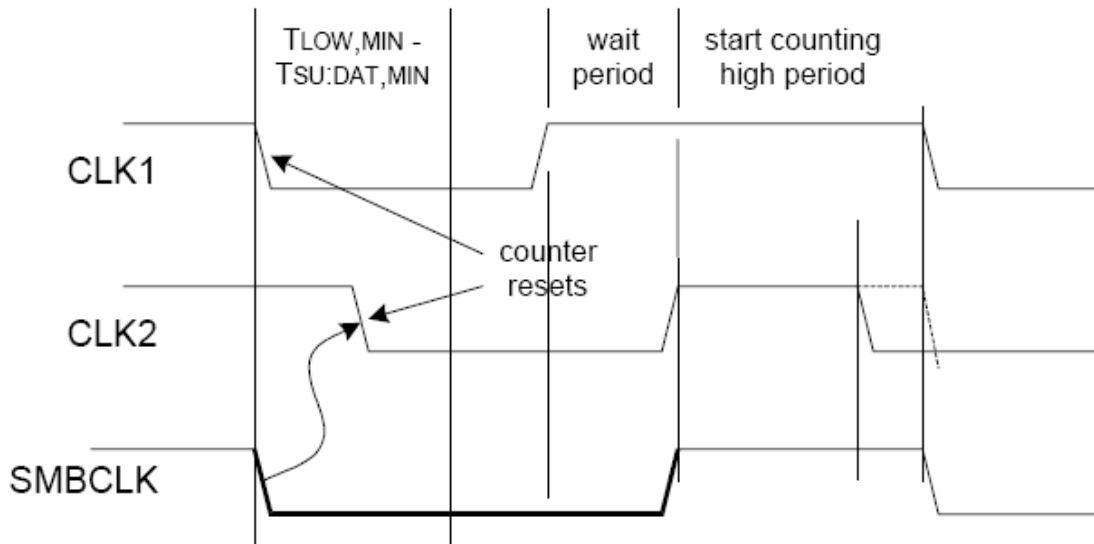

Figure 18-3 Clock synchronization

### 18.3 SB-TSI

The combined-format repeated start sequence is not supported in standard-mode and fast-mode.

- ◆ Only 7-bit SMBus addresses are supported.
- ◆ SB-TSI implements the Send/Receive Byte and Read/Write Byte protocols.
- ◆ SB-TSI registers can only be written using a write byte command.
- ◆ Address Resolution Protocol (ARP) is not implemented.
- ◆ Packet Error Checking (PEC) is not supported.

#### 18.3.1 SB-TSI Address

The SMBus address is really 7 bits. The SB-TSI address is normally 98h or 4Ch. The address could vary with address select bits.

Table 18-1 SB-TSI Address Encoding

Address Select Bits	SB-TSI Address
000b	98h
001b	9Ah
010b	9Ch
011b	9Eh
100b	90h
101b	92h
110b	94h
111b	96h

### 18.4 PCH

The PCH provide system thermal data to EC. The EC can manage the fans and other cooling elements based on this data. A subset of the thermal collection is that the PCH can be programmed to alert the EC when a device has gone outside of its temperature limits.

#### 18.4.1 Command Summary

Table 18-2 PCH Command Summary

Trans-action	Slave Addr.	Data Byte 0 =Command	Data Byte 1 =Byte Count	Data Byte 2	Data Byte 3	Data Byte 4	Data Byte 5	Data Byte 6	Data Byte 7
Write STS Preferences	I2C	0x41	0x6	STS [47:40]	STS [39:32]	STS [31:24]	STS [23:16]	STS [15:8]	STS [7:0]
Write CPU Temp Limits	I2C	0x42	0x6	Lower Limit [15:8]	Lower Limit [7:0]	Upper Limit [15:8]	Upper Limit [15:8]		
Write MCH Temp Limits	I2C	0x43	0x2	Lower Limit [7:0]	Upper Limit [7:0]	na	na		

PRELIMINARY

Write IBX Temp Limits	I2C	0x44	0x2	Lower Limit [7:0]	Upper Limit [7:0]	na	na		
Write DIMM Temp Limits	I2C	0x45	0x2	Lower Limit [7:0]	Upper Limit [7:0]	na	na		
Write MPC CPU Power Clamp	I2C	0x50	0x2	Lower Limit [7:0]	Power Clamp [7:0]				
Block Read	Block Read Address	0x40	Block Read Address	Byte Count	Data 0	Data N	PEC (optional)		

### 18.5 SMBus Master

#### 18.5.1 Block Diagram

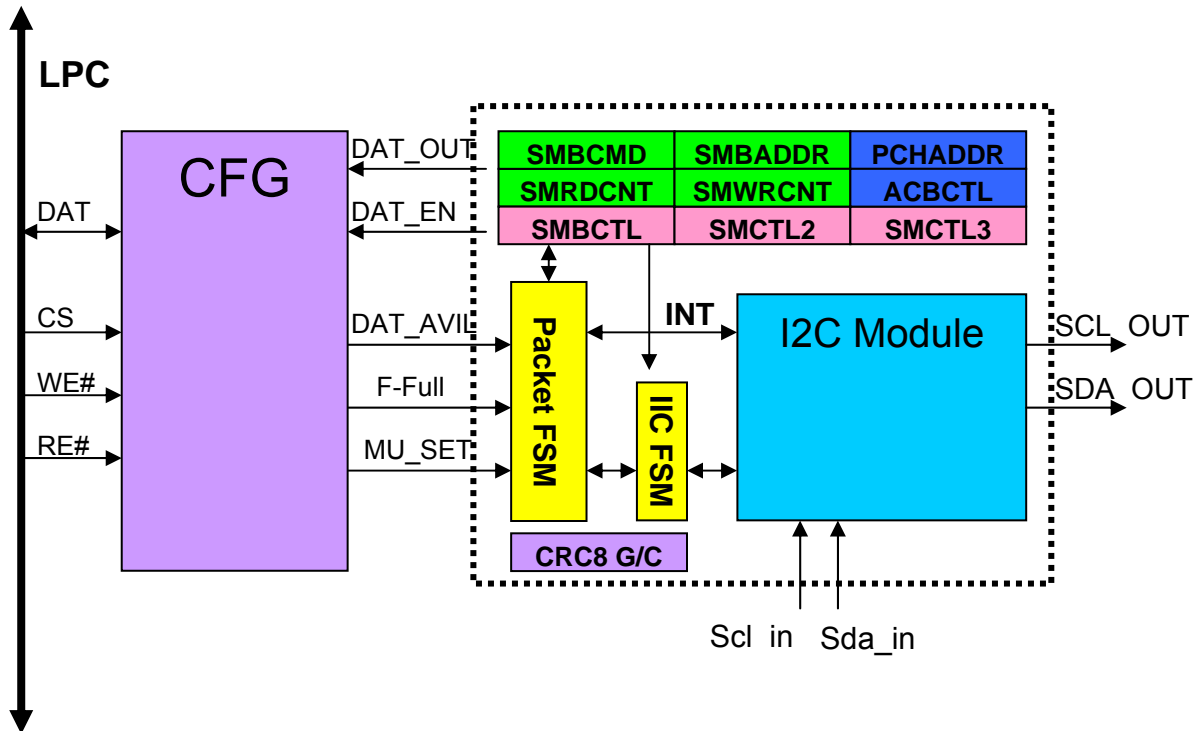

Figure 18-4 SMBus Master Block Diagram

18.5.2 Programming Flow

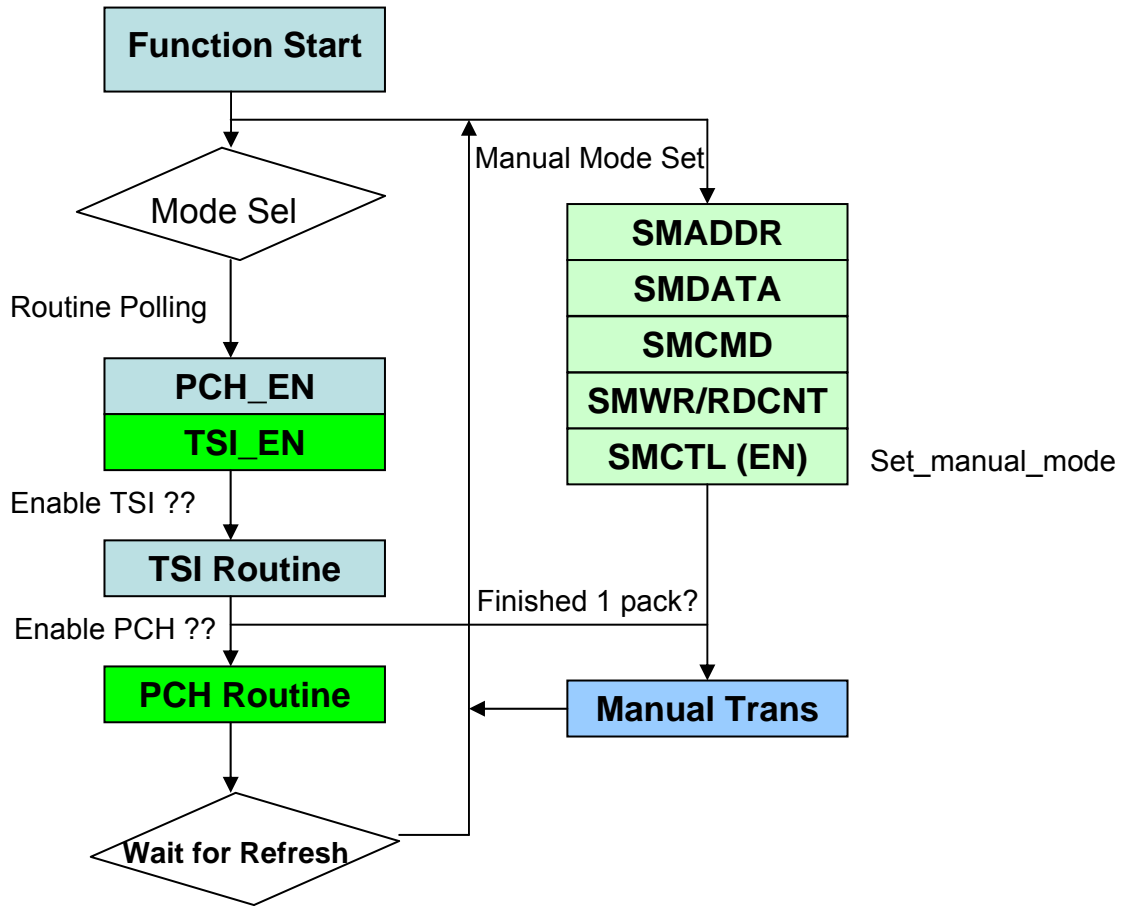

Figure 18-5 Programming Flow

18.5.3 TSI Routine

Figure 18-6 TSI Routine

18.5.4 PCH Routine

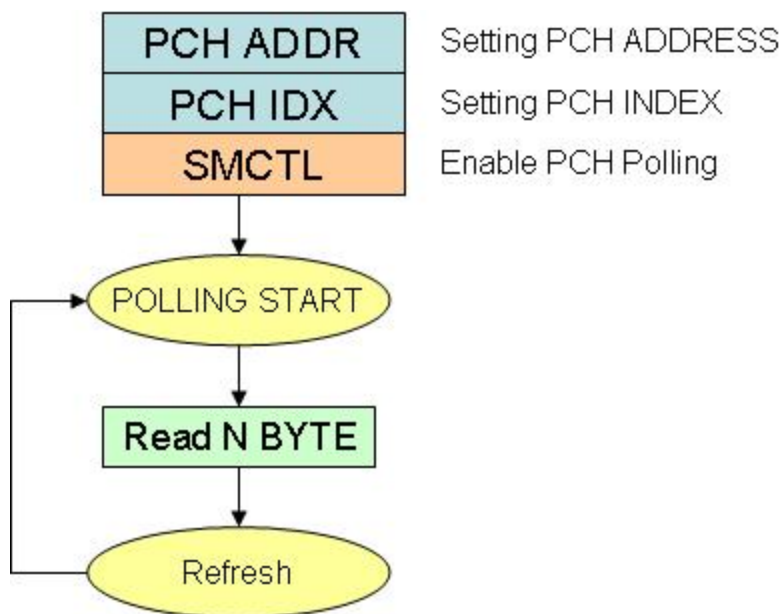

Figure 18-7 PCH Routine

18.5.5 BYTE Rutine

Figure 18-8 PCH Routine

18.5.6 Manual Mode interface

The SMBus host supports Block/Word/Byte Write and Block/Word/Byte read with PEC. The SMBus host can use the interface to access the smbus slave. The timing diagrams below illustrate how to use the smbus interface to write the data or read the data to the smbus slave.

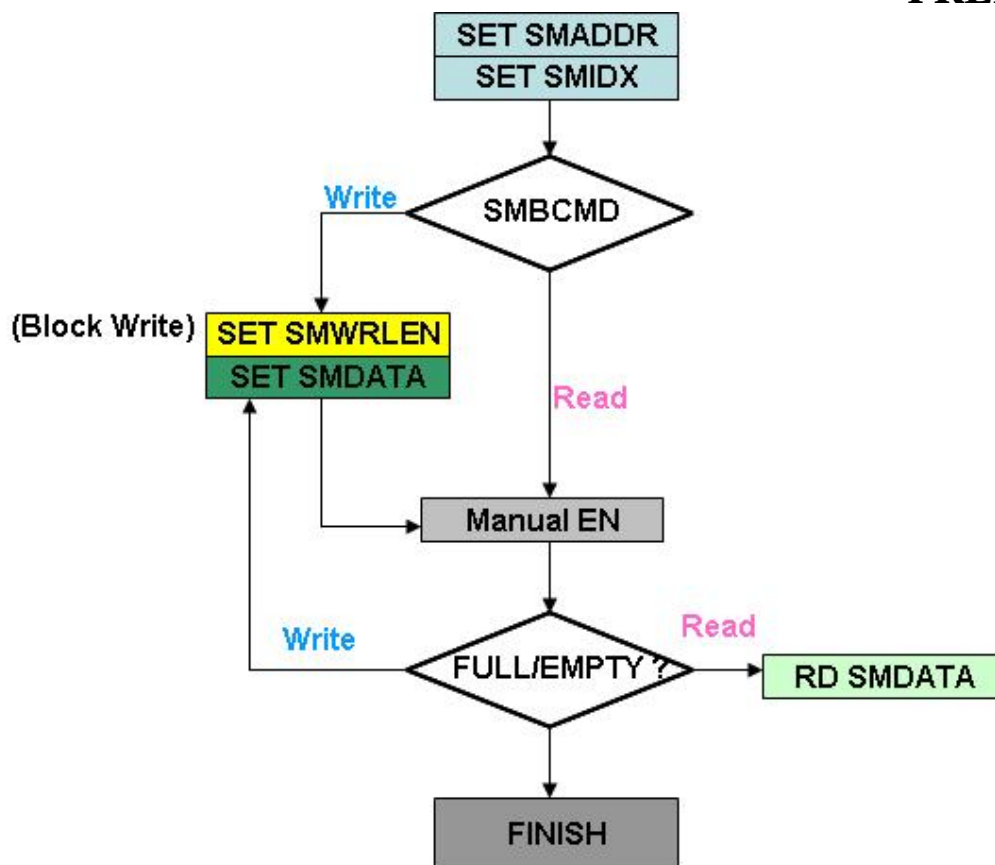

Figure 18-9 Manual Mode Programming Flow

### 18.6 Register Type Abbreviations

The following abbreviations are used to indicate the Register Type:

- ◆ R/W = Read/Write.
- ◆ R = Read from register.
- ◆ W = Write.
- ◆ RO = Read-only.

To program the SMBus master configuration registers, the following configuration procedures must be followed in sequence:

- (1). Enter the Extended Function Mode.
- (2). Configure the configuration registers.

#### 18.6.1 Enter the Extended Function Mode

To place the chip into the Extended Function Mode, two successive writes of 0x26 must be applied to Extended Function Enable Registers (EFERs, i.e. 2Eh or 4Eh).

### 18.6.2 Configure the Configuration Registers

The chip selects the Logical Device and activates the desired Logical Devices through Extended Function Index Register (EFIR) and Extended Function Data Register (EFDR). The EFIR is located at the same address as the EFER, and the EFDR is located at address (EFIR+1).

First, write the Logical Device Number (i.e. 0x07) to the EFIR and then write the number of the desired Logical Device to the EFDR. If accessing the Chip (Global) Control Registers, this step is not required.

Secondly, write the address of the desired configuration register within the Logical Device to the EFIR and then write (or read) the desired configuration register through the EFDR.

## 18.7 SMBus Master Register Set

### 18.7.1 SMBus Register Map

SMBus Master base address in register Logic Device B CR62h(MSB), CR63h(LSB).

Table 18-3 SMBus Master Bank 0 Registers

Offset	Type	Name	Section
0	R/W	<b>SMBus Data</b>	19.7.2
1	R/W	<b>SMBus Write Data Size</b>	19.7.3
2	R/W	<b>SMBus Command</b>	19.7.4
3	R/W	<b>SMBus Index</b>	19.7.5
4	R/W	<b>SMBus Control</b>	19.7.6
5	R/W	<b>SMBus Address</b>	19.7.7
6	R/W	<b>SMBCLK Frequency</b>	19.7.8

### 18.7.2 SMBus Data (SMDATA) – Bank 0

This 32 bits register is the data in and out register of SMBus data register. Before writing to SMDATA register, this register contains the input data, after writing to SMDATA register, this register contains the output data.

**PRELIMINARY**

Offset: 0h

Type: R/W

Byte	3	2	1	0
Name	<b>SMFIFO3</b>	<b>SMFIFO2</b>	<b>SMFIFO1</b>	<b>SMFIFO0</b>
Default	00h	00h	00h	00h

Byte	Description
3	<b>SMFIFO3 (SMBus FIFO 3).</b> This byte represents the high byte of the 32 bits SMBus data.
2	<b>SMFIFO2 (SMBus FIFO 2).</b> This byte represents the second byte of the 32 bits SMBus data.
1	<b>SMFIFO1 (SMBus FIFO 1).</b> This byte represents the first byte of the 32 bits SMBus data.
0	<b>SMFIFO0 (SMBus FIFO 0).</b> This byte represents the low byte of the 32 bits SMBus data.

**18.7.3 SMBus Write Data Size (SMWRSIZE) – Bank 0**

Offset: 1h

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	Reserved			<b>SMWRSIZE</b>				
Default	0	0	0	0	0	0	0	0

Bit	Description
7-5	Reserved.
4-0	<b>SMWRSIZE (SMBus Write Byte Counter).</b> This field sets the write byte counter, the max counter size is 32 bytes, and the minimal size is 1 bytes.

**18.7.4 SMBus Command (SMCMD) – Bank 0**

Offset: 2h

Type: R/W

Bit	7	6	5	4	3	2	1	0
NAME	REV				SMBus CMD			
Default	0	0	0	0	0	0	0	0

Bit	Description
7-4	Reserved.

**PRELIMINARY**

3-0	<p><b>SMBCMD (SMBus Command).</b>                  This field sets SMBus Command:                  0000 : Read Byte (Default)                  0001 : Read Word                  0010 : Read Block                  0011 : Block Write and Read Process Call                  0100 : Process Call                  1000 : Write Byte                  1001 : Write Word                  1010 : Write Block</p>
-----	---

**18.7.5 SMBus INDEX (SMIDX) – Bank 0**

Offset: 3h

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	<b>SMCMD</b>							
Default	0	0	0	0	0	0	0	0

Bit	Description
7-0	<b>SMIDX (SMBus INDEX).</b> This field represents the index data of the SMBus.

**18.7.6 SMBus Control (SMCTL) – Bank 0**

Offset: 4h

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	<b>MMODE_S</b>	<b>S_RST</b>	<b>CRC8_EN</b>	<b>REFLASH_CLK</b>			<b>BYTE_EN</b>	<b>PCH_EN</b>
Default	0	0	0	0	0	0	0	0

Bit	Description
7	<b>MMODE_S (Manual Mode Set).</b> 0 : Disable. 1 : Enable.
6	<b>S_RST (Soft Reset SMBus).</b> 0 : Disable. 1 : Enable.
5	<b>CRC8_EN (CRC8 Enable).</b> 0 : CRC8 function is disable. 1 : CRC8 function is enable.

**PRELIMINARY**

4-2	<b>REFRASH_CLK (Refrash Clock Select).</b> 000, 100 – 128ms 001, 101 – 256ms 010, 110 – 512ms 011, 111 – 64ms (1KHz)
1	<b>BYTE_EN (BYTE Enable).</b> 0 : BYTE function is disable. 1 : BYTE function is enable.
0	<b>PCH_EN (PCH Enable).</b> 0 : PCH function is disable. 1 : PCH function is enable.

**18.7.7 SMBus Address (SMADDR) – Bank 0**

Offset: 5h

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	<b>SMADDR</b>							<b>REV</b>
Default	0	0	0	0	0	0	0	0

Bit	Description
7-1	<b>SMADDR (SMBus Address).</b> AMD-TSI only supports 7-bit SMBus address.
0	<b>Reserved:</b> 0 : Write. If the protocol is write, the WR_SIZE can't be zero. (Default)

**18.7.8 SCL FREQ (SCLFREQ) – Bank 0**

Offset: 6h

Type: R/W

Bit	7	6	5	4	3	2	1	0
	<b>Reserved:</b>				<b>SCLFREQ</b>			
Default	0	0	0	0	0	1	1	1

Bit	Description
7-4	Reserved

**PRELIMINARY**

3-0	<p><b>SCLFQ (SMBCLK Frequency).</b> This field defines the SMBCLK period (low time and high time). The clock low time and high time ate defined as follows:</p> <p>0000 : 365KHz          0001 : 261KHz          0010 : 200KHz          0011 : 162KHz          0100 : 136KHz          0101 : 117KHz          0110 : 103KHz          0111 : 92KHz (Default)          1000 : 83KHz          1001 : 76KHz          1010 : 71KHz          1011 : 65KHz          1100 : 61KHz          1101 : 57KHz          1110 : 53KHz          1111 : 47KHz</p>
-----	--

**18.7.9 PCH Address (PCHADDR) – Bank 0**

Offset: 8h

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	<b>PCHADDR</b>							<b>REV</b>
Default	1	0	0	1	0	1	0	0

Bit	Description
7-1	<b>PCHADDR (PCH Address).</b> PCH supports 8-bit SMBus address. The default address is 94h. The last bit is read or write bit. It needs to set to "0".

**18.7.10SMBus Error Status (Error\_status) – Bank 0**

Offset: 9h

Type: RO/W1C

Bit	7	6	5	4	3	2	1	0
Name	<b>REV</b>		<b>ADNACK</b>	<b>Timeout</b>	<b>Reserved</b>	<b>BER</b>	<b>NACK</b>	<b>Reserve</b>
Default	1	0	0	1	0	1	0	0

Bit	Description
7-6	<b>Reserved.</b>
5	<b>ADDR Non ACK.</b> This bit reflects SMBus occurred ADDRESS NON ACK in Manual mode..
4	<b>Timeout.</b> This bit reflects when SMBus occurs timeout.

**PRELIMINARY**

3	<b>Reserved.</b>
2	<b>BER (Bus Error).</b> This bit reflects when a start or stop condition is detected during data transfer, or when an arbitration problem is detected.
1	<b>NACK (Negative acknowledge).</b> This bit is set by hardware when a transmission is not acknowledged on the ninth clock. While NACK is set SCL will be drive low and subsequent bus transactions are stalled until NACK is cleared.
0	<b>Reserved.</b>

**18.7.11 PCH Command (PCHCMD) – Bank 0**

Offset: Bh

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	<b>PCHCMD</b>							
Default	0	1	0	0	0	0	0	0

Bit	Description
7-0	<b>PCHCMD (PCH Command).</b> This field represents the command data of the PCH. The default command is block read (40h).

**18.7.12 TSI Agent Enable Register (TSI\_AGENT) – Bank**

Offset: Dh

Type: RO

Bit	7	6	5	4	3	2	1	0
Name	AG7	AG6	AG5	AG4	AG3	AG2	AG1	AG0
Default	0	0	0	0	0	0	0	0

Bit	Description
7	<b>TSI_AGENT7 Enable.</b> : This bit reflects AMD-TSI Agent enable. 0: Disable 1: Enable
6	<b>TSI_AGENT6 Enable.</b> : This bit reflects AMD-TSI Agent enable. 0: Disable 1: Enable
5	<b>TSI_AGENT5 Enable.</b> : This bit reflects AMD-TSI Agent enable. 0: Disable 1: Enable
4	<b>TSI_AGENT4 Enable.</b> : This bit reflects AMD-TSI Agent enable. 0: Disable 1: Enable

**PRELIMINARY**

3	<b>TSI AGENT3 Enable.</b> : This bit reflects AMD-TSI Agent enable. 0: Disable 1: Enable
2	<b>TSI AGENT2 Enable.</b> : This bit reflects AMD-TSI Agent enable. 0: Disable 1: Enable
1	<b>TSI AGENT1 Enable.</b> : This bit reflects AMD-TSI Agent enable. 0: Disable 1: Enable
0	<b>TSI AGENT0 Enable.</b> : This bit reflects AMD-TSI Agent enable. 0: Disable 1: Enable

**18.7.13 SMBus Control 3 Register (SMCTL3) – Bank 0**

Offset: Eh

Type: RO

Bit	7	6	5	4	3	2	1	0
Name	Reserved				CRC_CHK	M_MODE	F_FULL	F_EMPTY
Default	0	0	0	0	0	0	0	0

Bit	Description
7-4	<b>Reserved</b>
3	<b>CRC_CHK (CRC Check).</b> 0 : incorrect 1 : correct
2	<b>M_MODE (Manual Mode).</b> 0 : Non-active 1 : Active
1	<b>F_FULL (fifo_full).</b> : This bit reflects SMBus data fifo is full. 0 : Non-full 1 : Full
0	<b>F_EMPTY (fifo empty).</b> : This bit reflects the SMBus data fifo is empty. 0 : Non-empty 1 : Empty

**18.7.14 SMBus Control 2 Register (SMCTL2) – Bank 0**

Offset: Fh

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	Reserved		INT_LCH_E	Reserved		BYTE_SEL	BANKSEL	
Default	0	0	0	0	0	0	0	0

Bit	Description
7-6	<b>Reserved.</b>
5	<b>INT_LCH_E (Interrupt Latch Enable).</b> : This bit will latch the I2CSTA register. 0 : Disable. 1 : Enable.
2	<b>BYTE_SEL</b> :This field represents byte polling 8-bit/16bit select bits. 0: BYTE_TEMP is 16 bit data 1: BYTE_TEMP is 8 bit data
1-0	<b>BANKSEL (Bank Select).</b> 00 – Bank 0. 01 – Bank 1. 10 – Bank 2.

**18.7.15 BYTE ADDRESS (BYTE ADDR) – Bank 0**

Offset: 10h

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	<b>BYTE_ADDRESS</b>							
Default	0	1	0	0	0	0	0	0

Bit	Description
7-0	<b>BYTE ADDRESS (BYTE ADDR).</b> This field represents the address data of the BYTE.

**18.7.16 BYTE INDEX\_H (BYTE\_IDX\_H) – Bank 0**

Offset: 11h

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	<b>BYTE_IDX_H</b>							
Default	0	0	0	0	0	0	0	1

Bit	Description
7-0	<b>BYTE_IDX_H (High BYTE INDEX).</b> This field represents the high byte index of the Byte polling. The default command is byte read (01h).

**PRELIMINARY**

**18.7.17 BYTE INDEX\_L (BYTE\_IDX\_L) – Bank 0**

Offset: 12h

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	<b>BYTE_IDX_L</b>							
Default	0	0	0	1	0	0	0	0

Bit	Description
7-0	<b>BYTE_IDX_L (LOW BYTE INDEX).</b> This field represents the low byte index of the Byte polling. The default command is byte read (10h).

The EC may read thermal information from IBX using the SMBus block read command. The IBX doesn't support byte-read or word-read SMBus commands. The read use a different address that the writes. The address must be different so that the IBX knows which target is intended, either the I2C target or the block read buffer.

The IBX and EC are set up by BIOS with the length of the read that is supported by the platform. The EC must always do reads of the lengths set up by BIOS. There is no way to change the length of the read after BIOS has set things up.

An EC that only wants the single highest temperature among MCH, and CPU could read one byte. A 2 byte read would provide both IBX and CPU/MCH package temperature. An EC that wanted each components temperature would do a 4 byte read. An EC that also wanted DIMM information would read 9 bytes. If an EC wanted to read the HOST STS status, it must read 19 bytes. An EC can also read the energy data provided by the CPU by reading 12 bytes.

## 19. CONFIGURATION REGISTER

### 19.1 Chip (Global) Control Register

#### Default Value of Global Control Register:

Register	Default	Register	Default	Register	Default
CR 07h	00h	CR 20h	C5h (ID_H)	CR 2Bh	00h
CR 10h	FFh	CR 21h	61h (ID_L)	CR 2Ch	01h
CR 11h	FFh	CR 22h	FFh	CR 2Fh	0ss0ssssb
CR 13h	00h	CR 24h	04h		
CR 14h	00h	CR 25h	00h		
CR 1Ah	00h	CR 26h	0s000000b		
CR 1Bh	70h	CR 27h	00h		
CR 1Ch	10h	CR 28h	00h		
CR 1Dh	00h	CR 2Ah	C0h		

Note. The value of “s” means hardware strapping result: strapping high will report 1; strapping low will report 0.

In addition, BIOS can write the value of strapping result after hardware strapping.

Note. The CR21h is low-byte of the Chip-ID; the “X” means IC version. EX. 61=A version, 62=B version, 63=C version.

#### Reserved Registers of Global Control Register:

Register	Default	Register	Default
CR 02h	00h	CR 1Eh	FFh
CR 12h	FFh	CR 1Fh	FFh
CR 15h	FFh	CR 23h	00h
CR 16h	FFh	CR 29h	FFh
CR 17h	FFh	CR 2Dh	FFh
CR 18h	FFh	CR 2Eh	00h
CR 19h	FFh		

Note. All reserved registers must keep default value.

Note. Before accessing CR10, CR11, CR13 and CR14, CR26 [Bit4] must be set to logic 1.

#### CR 07h. Logical Device Selection

Attribute: Read/Write

Power Well: VCC

Reset by: LRESET#

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	Logical Device Number.

**CR 10h. Device IRQ TYPE Selection**

Attribute: Read/Write  
 Power Well: VCC  
 Reset by: LRESET#  
 Default : FFh

BIT	READ / WRITE	DESCRIPTION
7-6	Reserved.	
5	R / W	UARTA IRQ TYPE SELECT (note1.) 0: Edge. 1: Level.

**CR E1h. GPIO7 Data Register**

Attribute: Read/Write  
 Power Well: VSB  
 Reset by: GP7X\_MRST  
 Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-4	Reserved	
3-0	R / W	GPIO7 Data register For output ports, the respective bits can be read/written and produced to pins.
	Read Only	For input ports, the respective bits can be read only from pins. Write accesses will be ignored.

**CR E2h. GPIO7 Inversion Register**

Attribute: Read/Write  
 Power Well: VSB  
 Reset by: GP7X\_MRST  
 Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-4	Reserved	
3-0	R / W	GPIO7 Inversion register 0: The respective bit and the port value are the same. 1: The respective bit and the port value are inverted. (Both Input & Output ports)

**CR E3h. GPIO7 Status Register**

Attribute: Read Only  
 Power Well: VSB  
 Reset by: GP7X\_MRST  
 Default : 00h

**PRELIMINARY**

BIT	READ / WRITE	DESCRIPTION
7-4	Reserved	
3-0	Read Only Read-Clear	GPIO7 Event Status Bit 7-0 corresponds to GP77-GP70, respectively. 0 : No active edge (rising/falling) has been detected 1 : An active edge (rising/falling) has been detected Read the status bit clears it to 0.

**CR E4h. GPIO8 I/O Register**

Location: Address E4h

Attribute: Read/Write

Power Well: VSB

Reset by: GP8X\_MRST

Default : FFh

Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO8 I/O register 0: The respective GPIO8 PIN is programmed as an output port 1: The respective GPIO8 PIN is programmed as an input port.

**CR E5h. GPIO8 Data Register**

Location: Address E5h

Attribute: Read/Write

Power Well: VSB

Reset by: GP8X\_MRST

Default : 00h

Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO8 Data register For output ports, the respective bits can be read/written and produced to pins.
	Read Only	For input ports, the respective bits can be read only from pins. Write accesses will be ignored.

**CR E6h. GPIO8 Inversion Register**

Location: Address E6h

Attribute: Read/Write

Power Well: VSB

Reset by: GP8X\_MRST

Default : 00h

Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
-----	--------------	-------------

**PRELIMINARY**

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO8 Inversion register 0: The respective bit and the port value are the same. 1: The respective bit and the port value are inverted. (Both Input & Output ports)

**CR E7h. GPIO8 Status Register**

Location: Address E7h

Attribute: Read Only

Power Well: VSB

Reset by: GP8X\_MRST

Default : 00h

Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7-0	Read Only Read-Clear	GPIO8 Event Status Bit 7-0 corresponds to GP87-GP80, respectively. 0 : No active edge (rising/falling) has been detected 1 : An active edge (rising/falling) has been detected Read the status bit clears it to 0.

**CR ECh. GPIO7 Multi-function Select Register**

Attribute: Read/Write

Power Well: VSB

Reset by: GP7X\_MRST

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-6	Reserved	
5	R / W	0: GPIO75 1: GPIO75 → BEEP (Please also set this GPIO to “output” type.)
4	R / W	0: GPIO74 1: GPIO74 → GRN (Please also set this GPIO to “output” type.)
3-0	Reserved	

**CR EDh. GPIO8 Multi-function Select Register**

Location: Address EDh

Attribute: Read/Write

Power Well: VSB

Reset by: GP8X\_MRST

Default : 00h

Size: 8 bits

BIT	READ / WRITE	DESCRIPTION
7	R / W	0: GPIO87 1: GPIO87 → YLW

**PRELIMINARY**

<b>BIT</b>	<b>READ / WRITE</b>	<b>DESCRIPTION</b>
6	R / W	0: GPIO86 1: GPIO86 → BEEP
5	R / W	0: GPIO85 1: GPIO85 → SMI
4	R / W	0: GPIO84 1: GPIO84 → WDTO
3	R / W	0: GPIO83 1: GPIO83 → YLW
2	R / W	0: GPIO82 1: GPIO82 → BEEP
1	R / W	0: GPIO81 1: GPIO81 → SMI
0	R / W	0: GPIO80 1: GPIO80 → WDTO

**19.7 Logical Device 8 (WDT1)**

**CR 30h.**

Attribute: Read/Write

Power Well: VCC

Reset by: LRESET#

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-4	Reserved	
3	R / W	0: GPIO Base Address mode is inactive 1: GPIO Base Address mode is active
2-1	Reserved	
0	R / W	0: WDT1 is inactive.                      1: WDT1 is active.

**CR 60h, 61h.**

Attribute: Read/Write

Power Well: VCC

Reset by: LRESET#

Default : 00h, 00h

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	These two registers select GPIO Interface I/O base address <100h: FF8h> on 1 byte boundary.

**CR F5h. Watchdog Timer I (WDT1) and KBC P20 Control Mode Register**

Attribute: Read/Write

Power Well: VCC

Reset by: LRESET# or PWROK(see LDA E7[3])

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-5	Reserved.	
4	R / W	Watchdog Timer I count mode is 1000 times faster. 0: Disable. 1: Enable. (If bit-3 is 0, the count mode is 1/1000 seconds mode.) (If bit-3 is 1, the count mode is 1/1000 minutes mode.)
3	R / W	Select Watchdog Timer I count mode. 0: Second Mode. 1: Minute Mode.
2	R / W	Enable the rising edge of a KBC reset to issue a time-out event. 0: Disable. 1: Enable.

**PRELIMINARY**

BIT	READ / WRITE	DESCRIPTION
1	R / W	Disable / Enable the Watchdog Timer I output low pulse to the KBRST# pin 0: Disable. 1: Enable.
0	R / W	Pulse or Level mode select 0: Pulse mode 1: Level mode

**CR F6h. Watchdog Timer I (WDT1) Counter Register**

Attribute: Read/Write

Power Well: VCC

Reset by: LRESET# or PWROK(see LDA E7[3])

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	Watch Dog Timer I Time-out value. Writing a non-zero value to this register causes the counter to load the value into the Watch Dog Counter and start counting down. If CR F7h, bits 7 and 6 are set, any Mouse Interrupt or Keyboard Interrupt event causes the previously-loaded, non-zero value to be reloaded to the Watch Dog Counter and the count down resumes. Reading this register returns the current value in the Watch Dog Counter, not the Watch Dog Timer Time-out value. 00h: Time-out Disable 01h: Time-out occurs after one cycle time, the cycle time is base on LD8 CRF5, bit[3], by analogy.

**CR F7h. Watchdog Timer I (WDT1) Control & Status Register**

Attribute: Read/Write

Power Well: VCC

Reset by: LRESET# or PWROK(see LDA E7[3])

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7	R / W	Mouse interrupt reset enables watch-dog timer reload 0: Watchdog Timer I is not affected by mouse interrupt. 1: Watchdog Timer I is reset by mouse interrupt.
6	R / W	Keyboard interrupt reset enables watch-dog timer reload 0: Watchdog Timer I is not affected by keyboard interrupt. 1: Watchdog Timer I is reset by keyboard interrupt.
5	Write "1" Only	Trigger Watchdog Timer I event. This bit is self-clearing.
4	R / W Write "0" Clear	Watchdog Timer I status bit 0: Watchdog Timer I is running. 1: Watchdog Timer I issues time-out event.
3-0	R / W	These bits select the IRQ resource for the Watchdog Timer I

**19.8 Logical Device 9 (GPIO2, GPIO4, GPIO5, GPIO7, GPIO8)**

**CR 30h.**

Attribute: Read/Write

Power Well: VSB

Reset by: RSMRST#

Default : 00h

BIT	READ / WRITE	DESCRIPTION	
7	R / W	0: GPIO7 is inactive.	1: GPIO7 is active
6	Reserved		
5	R / W	0: GPIO5 is inactive.	1: GPIO5 is active.
4	R / W	0: GPIO4 is inactive.	1: GPIO4 is active.
3	Reserved		
2	R / W	0: GPIO2 is inactive.	1: GPIO2 is active.
1	Reserved		
0	R / W	0: GPIO8 is inactive.	1: GPIO8 is active.

**CR E0h. GPIO2 I/O Register**

Attribute: Read/Write

Power Well: VSB

Reset by: GP2X\_MRST

Default : FFh

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO2 I/O register 0: The respective GPIO2 PIN is programmed as an output port 1: The respective GPIO2 PIN is programmed as an input port.

**CR E1h. GPIO2 Data Register**

Attribute: Read/Write

Power Well: VSB

Reset by: GP2X\_MRST

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO2 Data register For output ports, the respective bits can be read and written by the pins.
	Read Only	For Input ports, the respective bits can only be read by the pins. Write accesses are ignored.

**CR E2h. GPIO2 Inversion Register**

Attribute: Read/Write

Power Well: VSB

Reset by: GP2X\_MRST

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO2 Inversion register 0: The respective bit and the port value are the same. 1: The respective bit and the port value are inverted. (Applies to both input and output ports)

**CR E3h. GPIO2 Status Register**

Attribute: Read Only

Power Well: VSB

Reset by: GP2X\_MRST

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-0	Read Only Read-Clear	GPIO2 Event Status Bit 7-0 corresponds to GP27-GP20, respectively. 0 : No active edge (rising/falling) has been detected 1 : An active edge (rising/falling) has been detected Read the status bit clears it to 0.

Attribute: Read/Write

Power Well: VRTC

Reset by: Battery reset

Default : 20h

BIT	READ / WRITE	DESCRIPTION
7	R / W	DIS_SLPSUS_PULLUP (test mode) 0: Enable pin 44 (SLP_SUS#) internal pull-up. 1: Disable pin 44 (SLP_SUS#) internal pull-up.
6	R / W	RSMRST# Detect Source Select for Deep Sleep Mode. 0: RSMRST# detected source from PSOUT# voltage (Pin28). 1: Reserved  <b>Note.</b> Set to 0, if Deep S5 is enabled. Set to 1, if DSW is enabled.
5	Reserved	
4	R / W	dsw_wake_opt (test mode) 0: The PSOUT# will assert until SLPS3# high when deep s5 wakeup event happened. 1: The PSOUT# will assert until RSMRST_L high and SLP_SUS_L high when deep s5 wakeup event happened. <b>PS. This bit only active when PCH_DSW_EN &amp; (Deep S5 Enable   Deep S3 Enable)</b>
3	R / W	PCH DSW Enable 0: If PCH disable DSW function. 1: if PCH enable DSW function. (SLP_SUS# affects RSMRST#)
2	R / W	Reserved
1	R / W	Deep S3 Enable 0: If SLP_S3# state will not enter Deep S3 state. 1: If SLP_S3# state will enter Deep S3 state.
0	R / W	Deep S5 Enable 0: Disable Deep S5 function when into S5 state (SLP_S5#). 1: Enable Deep S5 function when into S5 state (SLP_S5#).

**CR E0h. Deep Sleep wake up PSOUT# delay time**

Attribute: Read/Write

Power Well: VSB

Reset by: RSMRST#

Default : **20h** (Default: 512ms)

BIT	READ / WRITE	DESCRIPTION
7-6	Reserved.	

**PRELIMINARY**

BIT	READ / WRITE	DESCRIPTION
5-0	R / W	Deep Sleep wake up PSOUT# delay time. When system wake up from deep sleep state, IO will issue a low pulse via PSOUT# after SYS_3VSB and wait a delay time. DELAY TIME = (Setting Value) * 16ms Example : maximum delay time = (3F) <sub>hex</sub> * 16ms = 1008ms

**CR E1h. Deep Sleep wake up PSOUT# pulse width**

Attribute: Read/Write

Power Well: VSB

Reset by: RSMRST#

Default : 04h (Default: 128 ms)

BIT	READ / WRITE	DESCRIPTION
7-4	Reserved.	
3-0	R / W	Deep Sleep wake up PSOUT# pulse width. When system wake up from deep sleep state, IO will issue a low pulse via PSOUT#.. Pulse Width = (Setting Value) * 32ms Example : maximum pulse width = (F) <sub>hex</sub> * 32ms = 480ms

**CR E2h. Deep Sleep Delay Time Control**

Attribute: Read/Write

Power Well: VRTC

Reset by: Battery reset

Default : 05h

BIT	READ / WRITE	DESCRIPTION
7	R / W	0: The unit of deep sleep delay time is second. 1: The unit of deep sleep delay time is Minute.
6-0	R / W	Deep Sleep Delay Time Control. When system leaves S0 State, IO will wait a delay time before entering into Deep Sleep State. Example: maximum delay time = 127 second/minute

## 20. SPECIFICATIONS

### 20.1 Absolute Maximum Ratings

SYMBOL	PARAMETER	RATING	UNIT
3VCC	Power Supply Voltage (3.3V)	-0.3 to 3.6	V
VI	Input Voltage	-0.3 to 3VCC+0.3	V
	Input Voltage (5V tolerance)	-0.3 to 5.5	V
TA	Operating Temperature	0 to +70	°C
TSTG	Storage Temperature	-55 to +150	°C

**Note:** Exposure to conditions beyond those listed under Absolute Maximum Ratings may adversely affect the life and reliability of the device.

### 20.2 DC CHARACTERISTICS

Output High Voltage	V <sub>OH</sub>	2.4			V	I <sub>OH</sub> = -12 mA
<b>OD12 – Open-drain output pin with 12mA sink capability</b>						
Output Low Voltage	V <sub>OL</sub>			0.4	V	I <sub>OL</sub> = 12 mA
<b>O24 – Output pin with 24mA source-sink capability</b>						
Output Low Voltage	V <sub>OL</sub>			0.4	V	I <sub>OL</sub> = 24 mA
Output High Voltage	V <sub>OH</sub>	2.4			V	I <sub>OH</sub> = -24 mA
<b>OD24 – Open-drain output pin with 24mA sink capability</b>						
Output Low Voltage	V <sub>OL</sub>			0.4	V	I <sub>OL</sub> = 24 mA
<b>O48 – Output pin with 48mA source-sink capability</b>						
Output Low Voltage	V <sub>OL</sub>			0.4	V	I <sub>OL</sub> = 48 mA
Output High Voltage	V <sub>OH</sub>	2.4			V	I <sub>OH</sub> = -48 mA
<b>OD48 – Open-drain output pin with 48mA sink capability</b>						
Output Low Voltage	V <sub>OL</sub>			0.4	V	I <sub>OL</sub> = 48 mA
<b>I/O<sub>V3</sub> – Bi-direction pin with source capability of 6 mA and sink capability of 1 mA for INTEL® PECL</b>						
Input Low Voltage	V <sub>IL</sub>	0.275*V <sub>tt</sub>		0.5*V <sub>tt</sub>	V	
Input High Voltage	V <sub>IH</sub>	0.55*V <sub>tt</sub>		0.725*V <sub>tt</sub>	V	
Output Low Voltage	V <sub>OL</sub>			0.25*V <sub>tt</sub>	V	
Output High Voltage	V <sub>OH</sub>	0.75*V <sub>tt</sub>			V	
Hysteresis	V <sub>Hys</sub>	0.1*V <sub>tt</sub>			V	
<b>O12cu – Output pin 12mA source-sink capability with controllable pull-up</b>						
Output Low Voltage	V <sub>OL</sub>			0.4	V	I <sub>OL</sub> = 12 mA
Output High Voltage	V <sub>OH</sub>	2.4			V	I <sub>OH</sub> = -12 mA
<b>OD12cu – Open-drain 12mA sink capability output pin with controllable pull-up</b>						
Output Low Voltage	V <sub>OL</sub>			0.4	V	I <sub>OL</sub> = 12 mA

21. AC CHARACTERISTICS

21.1 Power On / Off Timing

	T1	T2	T3	T4
<b>IDEAL TIMING</b>	64ms	Over 64ms at least	< 10ns	32ms

### 21.2 AC Power Failure Resume Timing

(1) Logical Device A, CR [E4h] bits [6:5] =00 means "OFF" state  
 ("OFF" means the system is always turned off after the AC power loss recovered.)

(2) Logical Device A, CR [E4h] bits [6:5]=01 means "ON" state.  
 ("ON" means the system is always turned on after AC power loss recovered.)

**\*\* What's the definition of former state at AC power failure?**

- 1) The previous state is "ON"  
VCC falls to 2.6V and SLP\_S3# keeps at VIH 2.0V

- 2) The previous state is "OFF"  
VCC fall to 2.6V and SLP\_S3# keeps at VIL 0.8V

To ensure that VCC does not fall faster than VSB in various ATX Power Supplies, the NCT5532D adds the option of "user define mode" for the pre-defined state before AC power failure. BIOS can set the pre-defined state for the system to be "On" or "Off". According to this setting, the system chooses the state after the AC power recovery.

Please refer to the descriptions of bit 6~5 of CR E4h and bit 4 of CR E6h in Logical Device A.

**CR E4h**

BIT	READ/WRITE	DESCRIPTION
6~5	R / W	Power-loss control bits => (VBAT) 0 0: System always turns off when it returns from power-loss state. 0 1: System always turns on when it returns from power-loss state. 1 0: System turns off / on when it returns from power-loss state depending on the state before the power loss. 1 1: User defines the resuming state before power loss.(refer to Logic Device A, CRE6[4])

**CR E6h**

BIT	READ/WRITE	DESCRIPTION
4	R / W	Power loss Last State Flag. (VBAT) 0: ON 1: OFF

21.3 Clock Input Timing

PARAMETER	48MHZ / 24MHZ		UNIT
	MIN	MAX	
Cycle to cycle jitter		300/500	ps
Duty cycle	45	55	%

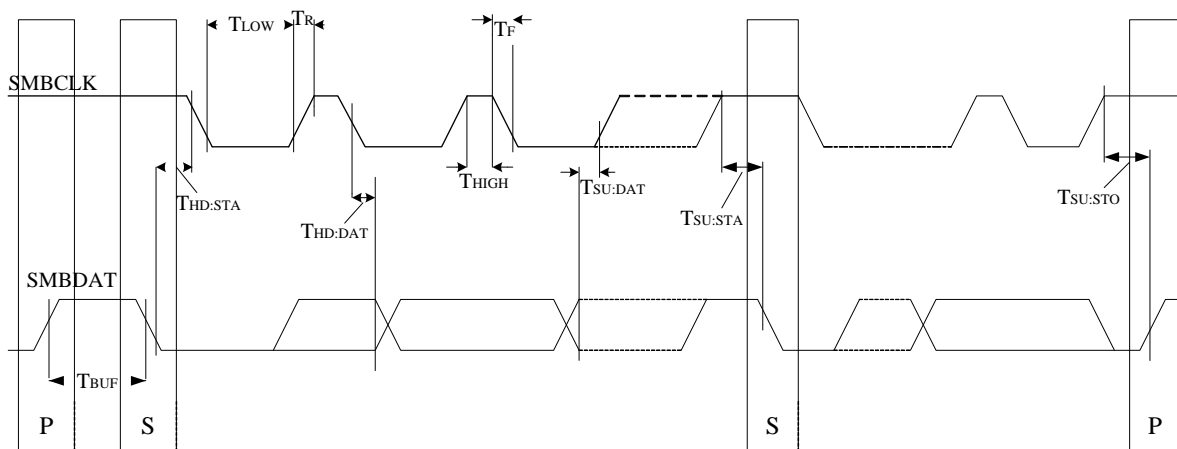

PARAMETER	DESCRIPTION	48MHZ / 24MHZ			UNIT
		MIN	TYP	MAX	
t1	Clock cycle time		20.8 / 41.7		ns
t2	Clock high time/low time	9 / 19	10 / 21		ns
t3	Clock rising time/falling time (0.4V~2.4V)			3	ns

21.4 PECl Timing

SYMBOL		MIN	TYP	MAX	UNITS
$t_{BIT}$	Client	0.495		500	$\mu s$
	Originator	0.495		250	
$t_{H1}$		0.6	3/4	0.8	$\times t_{BIT}$
$t_{H0}$		0.2	1/4	0.4	$\times t_{BIT}$

21.5 SMBus Timing

21.6 UART

PARAMETER	SYMBOL	TEST CONDITIONS	MIN.	MAX.	UNIT
Delay from Stop to Set Interrupt	TSINT		9/16		Baud Rate
Delay from $\overline{\text{IOR}}$ Reset Interrupt	TRINT		9	1000	nS
Delay from Initial IRQ Reset to Transmit Start	TIRS		1/16	8/16	Baud Rate
Delay from to Reset interrupt	THR			175	nS
Delay from Initial $\overline{\text{IOW}}$ to interrupt	TSI		9/16	16/16	Baud Rate
Delay from Stop to Set Interrupt	TSTI			8/16	Baud Rate
Delay from $\overline{\text{IOR}}$ to Reset Interrupt	TIR		8	250	nS
Delay from $\overline{\text{IOR}}$ to Output	TMWO		6	200	nS
Set Interrupt Delay from Modem Input	TSIM		18	250	nS
Reset Interrupt Delay from $\overline{\text{IOR}}$	TRIM		9	250	nS
Baud Divisor	N	100 pF Loading		$2^{16}-1$

21.8 GPIO Timing Parameters

SYMBOL	PARAMETER	MIN.	MAX.	UNIT
$t_{WGO}$	Write data to GPIO update		300(Note 1)	ns

Note: Refer to Microprocessor Interface Timing for Read Timing.

21.8.1 GPIO Write Timing

GPIO Write Timing diagram

## 22. TOP MARKING SPECIFICATIONS

1st line: Nuvoton logo

2nd line: part number: NCT5532D (Green package)

3rd line: wafer production series lot number: **28201234**

4th line: tracking code 123G9AFA

**123**: packages made in 2011, week 23

**G**: assembly house ID; G means GR, A means ASE, etc

**9**: code version; 9 means code 009

**A**: IC revision; A means version A; B means version B, and C means version C

**FA**: Nuvoton internal use

**23. ORDERING INFORMATION**

PART NUMBER	PACKAGE TYPE	PRODUCTION FLOW
NCT5532D	64Pin LQFP (Green package)	Commercial, 0°C to +70°C

24. PACKAGE SPECIFICATION

**PRELIMINARY**

VARIATIONS (ALL DIMENSIONS SHOWN IN MM)

SYMBOLS	MIN.	NOM.	MAX.
A	—	—	1.60
A1	0.05	—	0.15
A2	1.35	1.40	1.45
b	0.13	0.18	0.23
c	0.09	—	0.20
D	9.00 BSC		
D1	7.00 BSC		
e	0.40 BSC		
E	9.00 BSC		
E1	7.00 BSC		
L	0.45	0.60	0.75
L1	1.00 REF		
θ	0°	3.5°	7°

**64-pin (LQFP, 7x7x1.4mm)**

**25. REVISION HISTORY**

<b>VERSION</b>	<b>DATE</b>	<b>PAGE</b>	<b>DESCRIPTION</b>
0.1	06/23/2011	N.A.	Draft datasheet
0.2	07/20/2011	N.A.	Modify pin configuration
0.5	07/26/2011	N.A.	Add functional description and register information
0.6	09/28/2011	P.238, P.239	Correct GPIO (GP24, GP55) multi-function description
0.7	09/30/2011	P.239	Correct GPIO (GP54) multi-function description

**PRELIMINARY****Important Notice**

Nuvoton products are not designed, intended, authorized or warranted for use as components in systems or equipment intended for surgical implantation, atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, or for other applications intended to support or sustain life. Furthermore, Nuvoton products are not intended for applications wherein failure of Nuvoton products could result or lead to a situation wherein personal injury, death or severe property or environmental damage could occur.

Nuvoton customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Nuvoton for any damages resulting from such improper use or sales.
